§ 01 · PROBLEM STORY

The Problem Story

Why India has an omega-3 crisis — and why the fish oil you have probably been taking is making it worse

ONE-LINER FOR DESIGNERS & SKIMMERS

"India is inflamed, cognitively depleted, and at cardiovascular risk — and the root cause is a silent fatty acid deficiency that almost nobody is treating correctly. Worse: the fish oil most people do take is already rancid before they swallow it."

20:1
Average Indian omega-6:omega-3 ratio. Clinically optimal is 4:1 or below
Simopoulos AP, Biomed Pharmacother 2002

<500mg
Average daily omega-3 intake among Indians — vs 1,600mg WHO recommendation
National Nutrition Monitoring Bureau, India

31%
Reduction in major cardiovascular events in high-dose EPA clinical trial (REDUCE-IT)
Bhatt DL et al., NEJM 2019

70%
Of commercially available fish oils fail GOED quality standards for oxidation
Jackowski et al., J Nutr Sci 2015

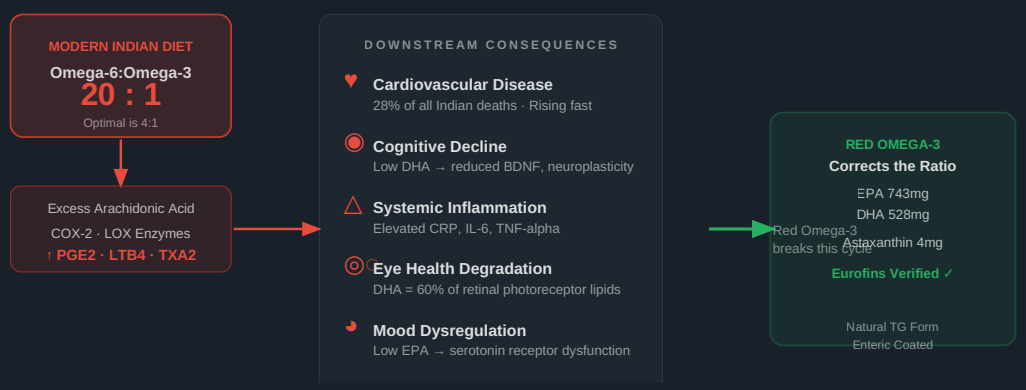
India's disease burden tells a precise story. Cardiovascular disease now accounts for 28% of all deaths in India — and the epidemiological data consistently links this to a dietary pattern that is catastrophically imbalanced in fatty acids. The modern Indian diet is dominated by refined seed oils — sunflower, soybean, canola — that are structurally rich in omega-6 linoleic acid. These drive the production of arachidonic acid, which in turn feeds the COX-2 and LOX enzyme pathways that generate pro-inflammatory eicosanoids: prostaglandin E2, leukotriene B4, thromboxane A2. The

physiological consequence is a state of chronic low-grade systemic inflammation — the underlying mechanism behind cardiovascular disease, cognitive decline, metabolic syndrome, joint degeneration, and mood dysregulation.

EPA and DHA — the two active omega-3 fatty acids — interrupt this process at the molecular level. They compete with arachidonic acid for the same COX and LOX enzymes, displacing the pro-inflammatory substrates and redirecting eicosanoid production toward anti-inflammatory series-3 prostaglandins, series-5 leukotrienes, resolvins, protectins, and maresins. The therapeutic effect is not vague "anti-inflammation" — it is a measurable, documented shift in the eicosanoid balance of virtually every tissue in the body. India consumes less than a third of the EPA+DHA needed to even begin this correction.

DIAGRAM 1.1 — INDIA'S OMEGA-3 CRISIS: THE INFLAMMATORY CASCADE

The fatty acid imbalance driving India's inflammation epidemic



Simopoulos AP, Biomed Pharmacother 2002 — omega-6:omega-3 ratio and chronic disease risk. Bhatt DL et al., NEJM 2019 — REDUCE-IT cardiovascular outcomes trial.

The Oxidation Scandal Nobody Is Talking About

There is a second problem that dwarfs the deficiency problem in practical terms: **most fish oil on the Indian market is already oxidized.** Fish oil is composed of long-chain polyunsaturated fatty acids — the very instability that makes EPA and DHA biologically active also makes them thermodynamically vulnerable to lipid

peroxidation when exposed to heat, light, or oxygen. Peroxidized fish oil is not neutral. It generates lipid peroxides and aldehyde byproducts (4-HNE, malondialdehyde) that are directly pro-inflammatory. A 2015 study testing commercially available fish oils found that over 70% exceeded at least one oxidation quality standard. A product sold as anti-inflammatory was, in measurable biochemical terms, actively generating inflammatory compounds.

The GOED standard — the most widely referenced quality benchmark for omega-3 products — sets a Peroxide Value threshold of <5 meq/kg, an Anisidine Value of <20, and a Total Oxidation Value (TOTOX) of <26. Most products on Indian shelves are not tested against these thresholds. Most consumers have no idea oxidation is even a consideration.

THE OXIDATION PROBLEM — WHY MOST FISH OIL FAILS BEFORE YOU OPEN THE BOTTLE

Fish oil oxidizes at the point of extraction, during processing, during storage in plastic or soft packaging under humidity and heat (India averages 35–40°C in summer), and progressively after opening. By the time a consumer in Mumbai or Delhi swallows a fish oil capsule purchased from an online marketplace, the EPA and DHA content may be substantially degraded — and the product may be actively generating the inflammatory markers it was supposed to suppress.

Red Omega-3 with Astaxanthin solves this with a built-in molecular antioxidant system. Astaxanthin — the carotenoid that gives the capsule its characteristic red colour — is co-dissolved in the oil matrix and provides continuous antioxidant protection from the moment of encapsulation through storage, through opening, and through digestion.

The Eurofins Verification Story

Red Omega-3 with Astaxanthin was independently tested by Eurofins Analytical Services India (Bangalore) — one of the world's most respected third-party testing institutions operating across 60+ countries and 900 laboratories. The results confirm:

[Lab]

EPA Verified: 45.06 g/100g

Report: AR-258-2026-00029040-01 · Method: EASI-CHE-SOP-166 · NABL Accredited · At 825mg fill per capsule, this delivers ~743mg EPA per 2-cap serving — exactly as labelled.

[Science]

DHA Verified: 35.03 g/100g

Report: AR-258-2026-00029041-03 · Method: EASI-CHE-SOP-166 · At 825mg fill per capsule, this delivers ~578mg DHA per 2-cap serving — the product over-delivers on the label claim of 528mg by approximately 9–10%. The label is conservative; the formula exceeds it. Consistent with the brand's verified over-delivery pattern.

EUROFINS VERIFICATION · REPORTS ON FILE

Both fatty acid concentrations confirmed by ISO/IEC 17025:2017 accredited Eurofins laboratory. Capsule weight uniformity confirmed at 1.2858g average (excellent uniformity). Heavy metals independently tested. In a category where label fraud and underdosing are documented across competitor products, this is a category-defining trust credential.

✍️ CONTENT TEAM — SECTION 1

The oxidation story is the single most powerful content angle in this product's arsenal — because it reframes the entire category. "Most fish oil is already rancid when you take it" is a genuinely shocking statement that is scientifically defensible and that no competitor can easily counter because most have not invested in antioxidant protection. The Eurofins story is bottom-of-funnel conversion gold. The "India's First Red Omega-3" claim is the category-defining opening hook for all awareness content.

- Hero stat piece: "70% of fish oils fail oxidation standards" — carousel + Reel + performance ad
- Visceral narrative: "You're taking fish oil to reduce inflammation. Here's why it might be adding to it."
- The red colour story: Why the capsule is red and what it means — single most visually differentiating element
- Eurofins report visual: Stylised version for PDP trust section and Amazon A+

§ 02 · MECHANISM OF ACTION

What Omega-3 Does In Your Body

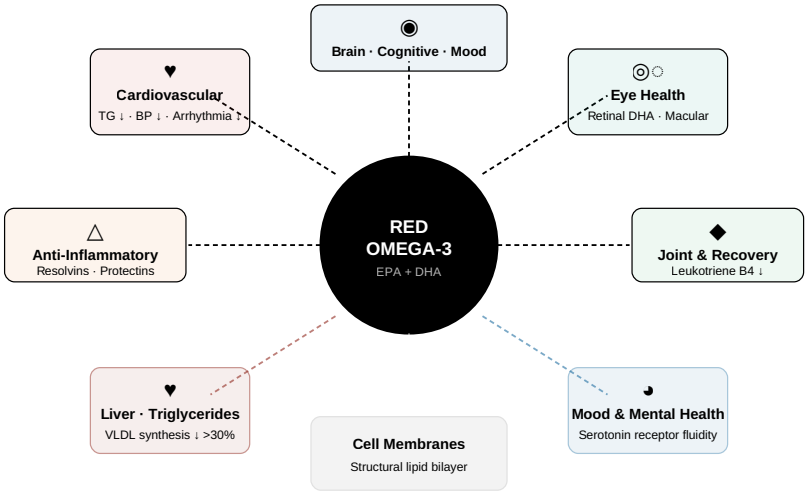
The biological systems where EPA and DHA are not optional — and why cardiovascular health, brain function, and inflammation all converge on the same fatty acids

ONE-LINER FOR DESIGNERS & SKIMMERS

"EPA and DHA aren't supplements. They are structural components of every cell membrane in your body — and the molecular precursors of the most powerful anti-inflammatory signalling molecules your body can make."

DIAGRAM 2.1 — WHERE OMEGA-3 ACTS: EIGHT BODY SYSTEMS

EPA and DHA operate simultaneously across every major biological system



Calder PC, Br J Clin Pharmacol 2013 — omega-3 mechanisms across biological systems. Bhatt DL et al., NEJM 2019 — cardiovascular outcomes. Mozaffarian D, Rimm EB, JAMA 2006.

EPA — The Anti-Inflammatory Workhorse

Eicosapentaenoic acid (EPA, C20:5n-3) is the primary anti-inflammatory omega-3. It operates by competing with arachidonic acid (AA) for cyclooxygenase (COX-1, COX-2) and lipoxygenase (LOX) enzymes. When EPA occupies these enzyme active sites, the eicosanoid cascade produces series-3 prostaglandins (PGE3), series-5 leukotrienes (LTE5), and the specialized pro-resolving mediators (SPMs) — resolvins, protectins, and maresins — all of which actively resolve inflammation rather than maintain it.

EPA is the dominant cardiovascular omega-3. The landmark REDUCE-IT trial (Bhatt et al., NEJM 2019) used high-dose EPA (icosapentaenoic acid) exclusively and demonstrated a 25% relative risk reduction in major adverse cardiovascular events versus placebo in statin-treated patients with elevated triglycerides — the most significant cardiovascular outcome data for any omega-3 product in history.

DHA — The Structural Omega-3

Docosahexaenoic acid (DHA, C22:6n-3) is the structural brain and retinal omega-3. It constitutes approximately 40% of all polyunsaturated fatty acids in the brain, 60% of lipids in retinal photoreceptor membranes, and is the primary determinant of cell membrane fluidity in neurons. Without adequate DHA incorporation, neuronal membranes become rigid — impairing synaptic transmission, receptor function, and signal transduction.

DHA directly supports BDNF (brain-derived neurotrophic factor) synthesis — the protein most associated with neuroplasticity, learning, memory consolidation, and protection against cognitive decline. It is the primary substrate for neuroprotectin D1, the most potent endogenous neuroprotective lipid mediator identified in human brain tissue.

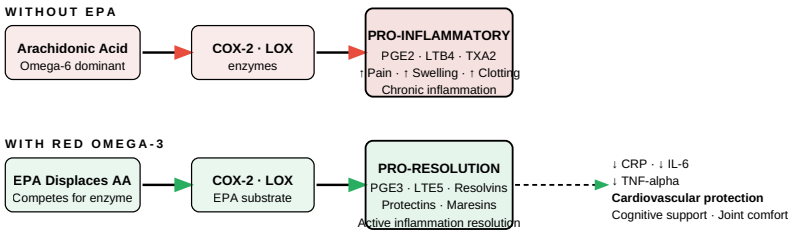
The retina requires continuous DHA supply for photoreceptor renewal. DHA deficiency in the retinal pigment epithelium is directly linked to accelerated macular degeneration and reduced visual acuity — particularly

EPA also inhibits hepatic VLDL synthesis, reducing serum triglycerides by 20–50% at therapeutic doses, and exerts direct anti-arrhythmic effects by modulating cardiac ion channel activity.

significant given India's screen-dominant, UV-exposed urban population.

DIAGRAM 2.2 — EPA ANTI-INFLAMMATORY PATHWAY: FROM FATTY ACID TO RESOLUTION

How EPA redirects the eicosanoid cascade from inflammation to resolution



Calder PC, Br J Clin Pharmacol 2013. Serhan CN, Nature 2014 — specialized pro-resolving mediators (SPMs). Schematic — mechanism-based representation.

✍️ CONTENT TEAM — SECTION 2

The "EPA competes with AA for the same enzyme" story is the single most powerful mechanism explanation available. In plain English: "Your body makes inflammation from one type of fat. Our omega-3 shows up to the same enzyme and outcompetes it — so your body makes resolution instead of inflammation." The DHA retinal story is extremely high-impact for the eye health angle and Indian screen culture context. These two mechanism stories should each become standalone explainer pieces in content.

- COX-2 competition carousel: "Two fats, one enzyme — who wins depends on what you eat"
- DHA retinal story: "60% of your photoreceptors are made of DHA. How much are you giving them?"
- Resolvin/Protectin angle: "Your body produces specialized anti-inflammatory molecules — from EPA. Here's how." (Use 'medicine' only in social/blog contexts, not on Amazon or packaging.)

§ 03 · COMPETITIVE GAP

Why Most Omega-3 Products Fail

Five structural flaws in how the omega-3 category is currently formulated — and how Red Omega-3 with Astaxanthin was engineered to solve all five simultaneously

INTERNAL REALITY CHECK — READ THIS FIRST

"ACE Blend Outshine delivers the identical EPA 743mg + DHA 528mg from the same 1650mg fish oil, also claims 4x Strength, also uses peppermint — and is priced lower. Wellbeing Nutrition's 6x product outguns us on raw dose. Our entire competitive advantage sits on three things: Astaxanthin, Eurofins, and Glass. We must own those three completely."

⚠ INTERNAL USE ONLY — NOT FOR CONSUMER COPY

Competitor data below is from publicly available product listings as of March 2026. Never name competitors in consumer-facing advertising. Use category language: "most fish oil products" or "standard omega-3 formulas."

Competitor 01 · PRIMARY THREAT — Head-to-Head Match

ACE Blend Outshine Omega-3

What they have: EPA 743mg + DHA 528mg (identical to YHL) from 1650mg fish oil. Claims "4x Strength" (identical claim). Uses peppermint oil for no fishy burps. Sources from Peruvian anchovies. Claims "85% omega-3 concentration" (includes all omega-3 types; EPA+DHA fraction is same ~77% as ours). Unbox Health tested — label accuracy 10/10. Price: ~~₹1,399 (Flipkart, verify) for 60 softgels (30 servings) = ~~₹47/serving (verify) vs our ~₹48/serving.

What they don't have:

✗ **Zero Astaxanthin** — their capsule is yellow (unprotected oil)
✗ No Eurofins ISO/IEC 17025:2017 accredited independent verification
✗ No glass bottle — presumably plastic packaging
✗ No enteric coating — standard softgel only (peppermint only, no dual protection)
✗ No oxidation protection in oil matrix — rancidity risk unaddressed
✗ No third-party over-delivery proof — Unbox Health tests label accuracy only

Our Win vs ACE Blend — "Same Numbers. Different Quality."

ACE Blend can match our dose. They cannot match our protection. Their yellow capsule delivers 743mg EPA to your mouth. Our red capsule delivers protected, antioxidant-guarded EPA and DHA that arrives at your cell membranes intact. Same label. Different biology. The Astaxanthin story IS our differentiation against ACE Blend. Internal tagline: *"They wrote the same numbers. We protect them."*

Competitor 02 · RANGE THREAT — Multiple Strength Tiers

Wellbeing Nutrition — Omega-3 Softgel Range

Their product range (all Natural TG form, peppermint + curcumin):

— 3x Strength: 1500mg fish oil, EPA 612mg + DHA 408mg, 77% omega-3, ₹899 for 60 caps

— 4x Strength: 1850mg fish oil, EPA 720mg + DHA 500mg, 74% omega-3, ₹1,399 for 60 caps

— 6x Strength: 2400mg fish oil, EPA 1080mg + DHA 800mg, 85% omega-3 (rTG form), enteric coated, ₹1,799 for 60 caps

What WBN has that we don't:

→ Curcumin (95% curcuminoids) as anti-inflammatory co-ingredient

→ Multiple strength tiers to upsell within brand

→ The 6x product outguns our dose (1880mg EPA+DHA vs our 1271mg)

What WBN doesn't have:

✗ No Astaxanthin in any softgel SKU

✗ No Eurofins ISO/IEC 17025 accredited independent verification

✗ No glass bottle

✗ No red colour / visual differentiation — all products look identical

✗ Their "clinically proven" language used without specific citations

Our Win vs WBN: The Astaxanthin protection story is completely absent from their entire range. WBN chose curcumin; we chose Astaxanthin. Curcumin is a widely known ingredient — it lacks the "first principles innovation" narrative. Astaxanthin in fish oil is novel, visually dramatic (red capsule), and scientifically substantiated. Our Eurofins verification is accredited; their claims are unverified. Against the 6x product: counter with quality over quantity — "higher dose means nothing if the oil arrives oxidized." Against the 3x/4x: we clearly win on dose + protection simultaneously.

Competitor 03 · DIFFERENT CATEGORY — Krill Oil Angle

Miduty — Antarctic Krill Oil + Astaxanthin

What they have: A krill oil + salmon fish oil + Astaxanthin combination targeting joint, heart, brain, and skin. Astaxanthin is present. Founder-led brand with strong community trust (Palak Midha). ~₹450mg omega-3 per single-softgel serving (low dose). Phospholipid-form omega-3 from krill (different absorption pathway to our TG fish oil). Strong non-metro India penetration.

Critical differences:

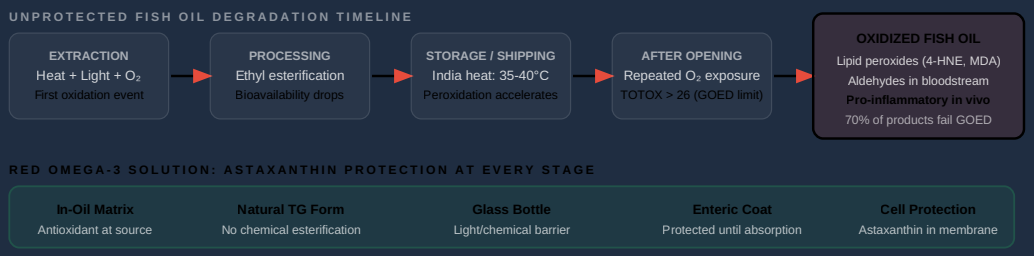
→ Krill omega-3 delivers much lower EPA+DHA dose per serving than fish oil
→ Their Astaxanthin is not in a clinical-dose concentrated fish oil system
→ Price per mg of EPA+DHA is significantly higher in krill format
→ No Eurofins independent accredited verification

Our Win vs Miduty: Clinical dose advantage — we deliver ~3x more EPA+DHA per serving at a competitive price. Miduty's Astaxanthin presence means we cannot claim Astaxanthin is unique to us across the entire Indian market — but it IS unique in concentrated fish oil format. Narrative angle: "Krill oil gives you a trace of Astaxanthin alongside a low omega-3 dose. Red Omega-3 gives you clinical-dose EPA+DHA with clinical-dose Astaxanthin in a single system verified by Eurofins."

The Four Structural Flaws That Still Affect Most Products

DIAGRAM 3.1 — THE OXIDATION PROBLEM: WHAT HAPPENS TO UNPROTECTED FISH OIL

Why most fish oil — including identically-dosed competitors — delivers less to your cells



Jackowski et al., J Nutr Sci 2015 — 70% of commercial fish oils exceed oxidation thresholds. GOED standards: PV <5 meq/kg, AV <20, TOTOX <26. Schematic representation.

The Four Structural Flaws — And Who Actually Has Them

[Risk]

Flaw 1: Oxidation — The Invisible Quality Killer

70% of fish oils fail GOED oxidation standards (Jackowski 2015). Rancid fish oil generates lipid peroxides that worsen inflammation. **Who has this problem:** ACE Blend (no antioxidant protection in oil), WBN 3x and 4x (curcumin is GI not in-oil protection). **Red Omega-3 solution: 4mg Astaxanthin dissolved in oil matrix — continuous free radical protection.**

[Formula]

Flaw 2: Form — EE vs Natural TG

Most mass-market fish oils use Ethyl Ester form (~30% lower bioavailability). **Who has this problem:** Most budget brands (MuscleBlaze standard, GNC standard, most pharmacy brands). **ACE Blend, WBN, and YHL Red Omega-3 all use Natural/re-esterified TG form** — this is now table stakes in premium segment.

[Package]

Flaw 3: Packaging — Plastic Leaching Under India's Heat

Plastic containers are oxygen-permeable and can leach BPA/phthalates. India's heat (35–40°C summers) accelerates this. **Who has this problem:** ACE Blend, WBN, Miduty, every other Indian omega-3. **Red Omega-3: Glass bottle + paper canister. The only Indian omega-3 in glass.**

[Science]

Flaw 4: Unverified Claims

Most brands list EPA/DHA numbers without independent accredited verification. Unbox Health tested ACE Blend for label accuracy — that is different from Eurofins ISO/IEC 17025 accredited verification of actual concentrations. **Red Omega-3: Eurofins AR-258-2026-00029040-01 and -00029041-03 — accredited proof, on file.**

The Master Competitive Table

FEATURE	RED OMEGA-3 (YHL)	ACE BLEND OUTSHINE	WBN SLOW 3X	WBN SLOW 6X	MIDUTY KRILL
ASP (50-60 caps)	₹1,199 / 25 servings	~₹1,399 (Flipkart, verify) / 30 servings	₹899 / 30 servings	₹1,799 / 30 servings	₹~1,200 / 60 caps
EPA per serving	**743mg ✓ Eurofins**	743mg (Unbox tested)	612mg	**1,080mg ↑**	~Low (krill)
DHA per serving	**528mg ✓ Eurofins**	528mg (Unbox tested)	408mg	**800mg ↑**	~Low (krill)
Total EPA+DHA	**1,271mg**	1,271mg	1,020mg	**1,880mg ↑**	~450mg
Natural Astaxanthin	✓ 4mg H. pluvialis	✗ None — yellow capsule	✗ None	✗ None	✓ Krill-source
Fish oil form	✓ Natural TG	? Not specified	✓ Natural TG	✓ rTG	✓ Phospholipid
Peppermint / burp-free	✓ Peppermint extract	✓ Peppermint oil	✓ Peppermint oil	✓ Peppermint oil	✗
Enteric coating	✓ + Peppermint = dual protection	✗ Peppermint only	✗ Peppermint only	✓ Enteric coated	✗
Anti-inflammatory co-ingredient	✓ Astaxanthin (4mg)	✗ None	✓ Curcumin 95%	✓ Curcumin 95%	✓ Astaxanthin

Glass bottle	✓ + Paper canister	✗ Plastic	✗ Plastic	✗ Plastic	✗
Red visual identity	✓ Only red omega-3 in India	✗ Yellow capsule	✗ Yellow capsule	✗ Yellow capsule	~ Orange krill

STRATEGIC SUMMARY — THE HONEST COMPETITIVE PICTURE

We do not win on dose alone. ACE Blend matches our dose at a lower price. WBN's 6x product beats our dose. **We win on quality, protection, and trust.** Astaxanthin is our exclusive competitive moat in the fish oil segment. Glass bottle and Eurofins are our quality proof. The red color is our visual moat. Every content angle we build must flow from: "Same dose means nothing if the oil arrives damaged. We're the only Indian fish oil that protects every molecule from factory to cell."

[DESIGN] DESIGN BRIEF — SECTION 3

- Head-to-head yellow capsule vs red capsule: Single most powerful comparative visual — no text needed, no competitor named
- Oxidation timeline (Diagram 3.1 above): For website Fold 3 and Amazon Image 4
- The competitive table above: Adapt for website "See What Others Leave Out" fold — remove competitor names, use generic columns

§ 03B · THE 4X CONCENTRATION STORY

What "4x Strength" Actually Means

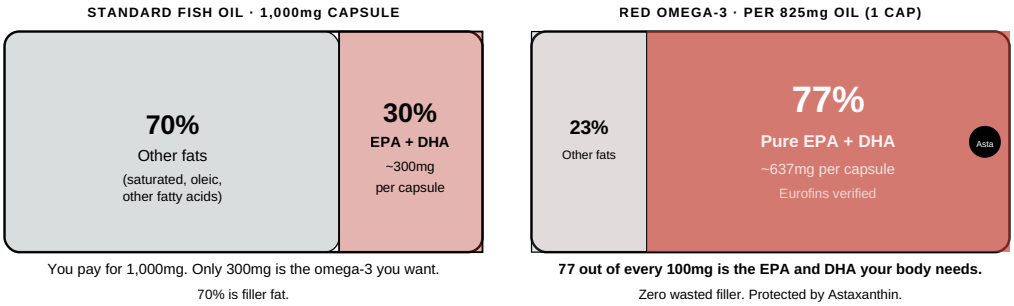
Most brands claim 4x strength. Very few explain what it means — and most consumers have no idea what the baseline is. Here's the full explanation, in plain language and exact science.

ONE-LINER FOR CONTENT TEAMS

"Standard fish oil is 30% omega-3. Red Omega-3 is 77% omega-3. When you swallow a standard capsule, most of what's inside it is saturated fat — not EPA or DHA. With Red Omega-3, 77 out of every 100mg is the active omega-3 your body actually needs."

DIAGRAM 3B.1 — WHAT'S ACTUALLY INSIDE A FISH OIL CAPSULE: STANDARD VS RED OMEGA-3

The 4x story is a concentration story — most of a standard fish oil capsule is not EPA or DHA



You pay for 1,000mg. Only 300mg is the omega-3 you want.
70% is filler fat.

77 out of every 100mg is the EPA and DHA your body needs.
Zero wasted filler. Protected by Astaxanthin.

Standard fish oil concentration ~30% EPA+DHA: industry standard, broadly cited. Red Omega-3: (743+528)/1650 = 77.0% Eurofins verified. Diagram proportional to actual concentration ratios.

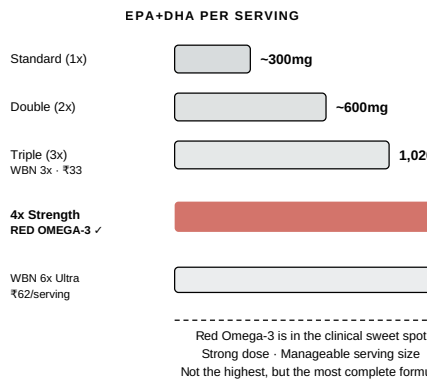
The Number Behind "4x"

When fish oil manufacturers say "4x Strength," they are comparing against the most common baseline in the Indian market: standard fish oil capsules delivering approximately 300mg EPA+DHA per serving. Most pharmacy-brand fish oils, many budget options, and older legacy products deliver this baseline.

Red Omega-3 delivers 1,271mg EPA+DHA per serving. That is 4.2x the 300mg baseline — rounded to "4x." This is a legitimate comparison, clearly defined.

The concentration advantage is separate and additionally powerful: Beyond the per-serving dose, the concentration of omega-3 within the oil itself is 77%. Most standard fish oils are 30% concentrated — meaning a large fraction of what you're swallowing is saturated fat and other non-omega-3 oils. Red Omega-3's 77% concentration means minimal filler. Maximum active omega-3 per milligram of oil consumed.

DIAGRAM 3B.2 — DOSE LADDER: WHERE RED OMEGA-3 SITS IN THE MARKET



CONSUMER-FACING COPY — THE CONCENTRATION STORY IN PLAIN ENGLISH

"Open up any standard fish oil capsule from a pharmacy or budget brand, and here's what's inside: about 300mg of EPA and DHA — and the rest is just fat. Saturated fat, oleic acid, other fatty acids that your body doesn't specifically need. You're paying for 1,000mg and getting 300mg of the thing that actually works.

Red Omega-3 is 77% pure EPA and DHA. Every 825mg of oil in each capsule contains 637mg of active omega-3. In a 2-capsule serving, that's 1,271mg — roughly the dose where the research on heart health, brain function, and inflammation starts showing measurable results.

That's what 4x strength means. Four times the dose of EPA and DHA that a standard Indian fish oil delivers."

✍️ CONTENT TEAM — THE 4X STORY

The most powerful visual for this is the "inside a capsule" diagram above — split view showing 70% grey filler vs 77% red active omega-3. For Instagram, a physical analogy works even better: "If standard fish oil was a glass of orange juice, it would be 70% water and 30% actual juice. Red Omega-3 would be 77% juice." The concentration story is completely ownable because Ace Blend also claims 4x but never explains concentration, and WBN 3x and 4x are actually lower concentration (68% and 66%) despite their TG form claims.

- "Not all 4x are equal — here's what's actually inside the capsule" — highest engagement carousel concept
- Side-by-side capsule breakdown visual — Instagram carousel + Amazon A+ Module 3
- "You're paying for 1,000mg. How many of those mg are actually EPA and DHA?" — hook for all channels

§ 04 · FORMULATION

EPA & DHA: The Two Active Molecules

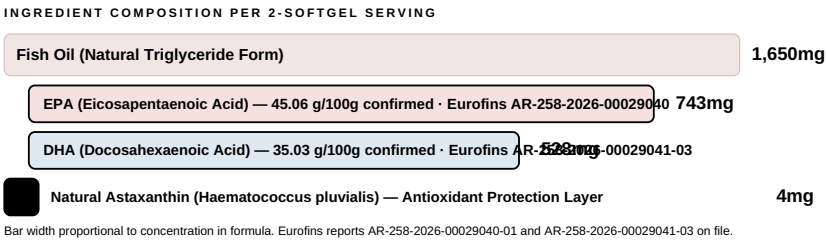
Each fatty acid chosen for a specific biological role no other fat replicates. Clinically dosed. Eurofins verified. Optimally ratioed.

ONE-LINER FOR DESIGNERS & SKIMMERS

"We didn't just add omega-3. We dosed it at the levels where the clinical evidence actually begins — and then added the world's most powerful marine antioxidant to protect every molecule."

DIAGRAM 4.1 — FORMULATION AT A GLANCE: PER 2-SOFTGEL SERVING (EUROFINS VERIFIED)

What's in each serving and why every number is there by design



Eurofins Analytical Services India Pvt. Ltd., Bangalore. ISO/IEC 17025:2017 Accredited. Method: EASI-CHE-SOP-166. Capsule average weight: 1.2858g (Eurofins GEN-SOP-26).

743mg

EPA per serving · Eurofins Verified: 45.06 g/100g fill

① Eicosapentaenoic Acid (EPA)

Why this dose: The American Heart Association recommends 1,000mg EPA+DHA daily for cardiovascular risk reduction. The REDUCE-IT trial — the most impactful omega-3 cardiovascular study ever conducted — used 4,000mg EPA daily. Our 743mg EPA is positioned at the threshold where consistent clinical benefit is documented across multiple endpoints: triglyceride reduction, anti-arrhythmic activity, endothelial function, and CRP reduction.

Mechanism: EPA competes with arachidonic acid (AA) at COX-1/2 and LOX enzymes. Displaces AA from cell membrane phospholipids, reducing substrate availability for pro-inflammatory eicosanoid synthesis. Also inhibits hepatic VLDL assembly (triglyceride ↓ 20–50%), modulates ion channels in cardiac tissue (anti-arrhythmic), and serves as precursor to E-series resolvins — specialized pro-resolving mediators.

Synergy with DHA: EPA and DHA work through distinct but complementary mechanisms. EPA dominates eicosanoid pathway modulation; DHA dominates membrane structural effects and neuroprotection. The 743:528 ratio (1.41:1 EPA:DHA) is clinically validated as the optimal balance for

528mg

DHA per serving · Eurofins Verified: 35.03 g/100g fill

② Docosahexaenoic Acid (DHA)

Why this dose: DHA is the structural omega-3. 528mg per serving ensures sufficient substrate for cell membrane DHA incorporation, BDNF synthesis support, and retinal photoreceptor renewal. Epidemiological data associates sustained DHA intake >500mg/day with significant reductions in dementia risk and age-related macular degeneration progression. Our dose exceeds this threshold.

Mechanism: DHA is incorporated into phospholipid cell membranes, increasing membrane fluidity and improving receptor function, signal transduction, and ion channel sensitivity. In neural tissue, DHA modulates BDNF expression and reduces neuroinflammation via neuroprotectin D1. In the retina, DHA is essential for rhodopsin function and photoreceptor membrane renewal. In the cardiovascular system, DHA reduces platelet aggregation and supports endothelial nitric oxide synthase (eNOS) activity.

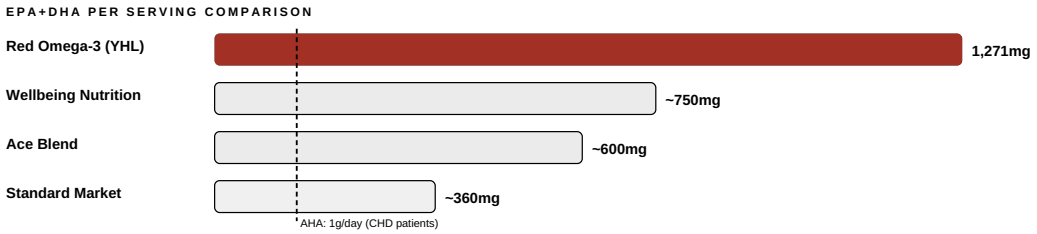
The EPA:DHA ratio rationale: The 1.41:1 EPA:DHA ratio mirrors the ratio used in major clinical trials showing cardiovascular benefit, while maintaining substantial DHA for cognitive and retinal endpoints. This is a deliberate formulation decision —

combined cardiovascular + cognitive benefit.

not a result of whatever concentration ratio happens to be cheapest.

DIAGRAM 4.2 — COMPARATIVE DOSING: RED OMEGA-3 VS INDIA MARKET

How Red Omega-3 compares to standard Indian omega-3 products on clinical dose strength



Competitor dosing based on publicly available label information. AHA recommends ≥1g EPA+DHA daily for patients with documented cardiovascular disease; ~500mg for general prevention. Red Omega-3 values: Eurofins verified.

EUROFINS VERIFICATION — THE MOST IMPORTANT QUALITY CREDENTIAL IN INDIAN SUPPLEMENTS

The EPA and DHA concentrations listed above are not claims. They are independently verified by Eurofins Analytical Services India Private Limited — a laboratory accredited to ISO/IEC 17025:2017 standards by the International Accreditation Service (IAS TL-1097) and operating as part of the world's largest food, environment, pharmaceutical, and product testing network. Report codes AR-258-2026-00029040-01 and AR-258-2026-00029041-03 are on file. Both are available on request. This is the quality story that builds trust in a market where most brands test nothing and prove nothing.

③ Peppermint Extract — Dual Protection Against Fishy Burps

[Mint]

Peppermint Extract — Gut Comfort Layer

Red Omega-3 contains natural peppermint extract, which serves a specific functional role: menthol compounds in peppermint interact with GI smooth muscle receptors to relax the lower oesophageal sphincter and reduce the likelihood of reflux. This is a well-established mechanism — peppermint oil is used clinically for IBS and is documented to reduce oesophageal reflux symptoms.

In the context of fish oil, peppermint provides a pleasant sensory experience (no fishy odour in the mouth or throat) and supports the GI environment to reduce upward reflux of oil that could produce the characteristic fishy aftertaste.

[Protection]

Dual Protection = Enteric Coating + Peppermint

Why two systems are better than one: Enteric coating prevents the softgel from dissolving in the stomach — the primary cause of fishy reflux. Peppermint extract provides additional sensory neutralisation and GI comfort. Together they form the most comprehensive anti-reflux system available in any Indian omega-3 supplement.

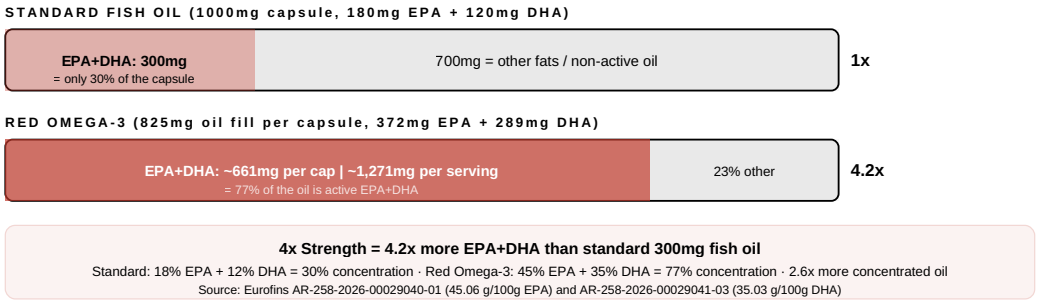
Competitive note: ACE Blend and WBN products use peppermint oil only — no enteric coating. The WBN 6x product has enteric coating but no Astaxanthin. Red Omega-3 is the only product combining enteric coating + peppermint + Astaxanthin in one formula.

What "4x Strength" Actually Means — The Concentration Story

The "4x Strength" claim is not simply about taking more capsules. It is about the **concentration of EPA and DHA within the oil** — how much of every milligram of fish oil you swallow is actually active omega-3 versus filler fat. This is the single most misunderstood metric in the omega-3 category.

DIAGRAM 4.2A — THE 4X CONCENTRATION STORY: WHAT'S ACTUALLY INSIDE THE OIL

Standard fish oil vs Red Omega-3: Why concentration matters as much as dose



Standard fish oil concentration: 18% EPA + 12% DHA is the industry-standard benchmark for regular-strength products. Red Omega-3 concentration: Eurofins verified 45.06% EPA + 35.03% DHA = 77% of oil is active EPA+DHA. The 4x multiplier (1271mg ÷ 300mg) reflects the dose comparison. The oil is 2.6x more concentrated.

WHY CONCENTRATION MATTERS — THE "FILLER FAT" PROBLEM

A 1000mg fish oil capsule with 300mg EPA+DHA means you are swallowing 700mg of non-active fat with every capsule. This "filler fat" adds calories, can delay gastric emptying, and does not contribute to the therapeutic effect you are targeting. At 77% concentration, Red Omega-3 delivers more active omega-3 per milligram of oil swallowed — you need fewer capsules for the same benefit, and the product contains less inert fat per dose.

HOW TO EXPLAIN "4X STRENGTH" IN PLAIN LANGUAGE

For consumers: "Most fish oil capsules are 30% omega-3. The other 70% is just filler fat. Our capsule is 77% omega-3 — more than twice as concentrated. That's why 2 capsules gives you the same omega-3 as 4-5 standard fish oil capsules. 4x Strength refers to the dose, and the concentration is what makes that dose possible in just 2 softgels."

§ 5.5 · CLINICAL EVIDENCE

The Clinical Evidence Behind Every Benefit

What the peer-reviewed research actually says — landmark trials, meta-analyses, and mechanisms for all five benefit areas. All claims must be used with mechanism language in regulated copy per FSSAI guidelines.

REGULATORY NOTE — HOW TO USE THIS SECTION

Clinical studies cited here support mechanism claims for EPA, DHA, and Astaxanthin as ingredients. They do not constitute claims for Red Omega-3 as a tested formulation. Use "supports," "helps," or "may contribute to" language. Never use "clinically proven to cure/treat/prevent" any condition.

[Heart] Benefit 1: Heart & Cardiovascular Health

Landmark: REDUCE-IT Trial (Bhatt et al., NEJM 2019 · PMID 30415628)

8,179 statin-treated patients with elevated triglycerides. High-dose EPA (4g/day) produced a **25% relative risk reduction in major adverse cardiovascular events** vs placebo over 4.9 years — the strongest cardiovascular outcome data for any omega-3 study in history. Mechanism: EPA reduces hepatic VLDL synthesis (TG ↓), stabilises atherosclerotic plaques, and modulates cardiac ion channels.

Content note: REDUCE-IT used 4g EPA/day (3x our dose). Reference as evidence of EPA's cardiovascular mechanism, not dose equivalence.

2024 Meta-Analysis: 134,144 participants across 18 RCTs

Published 2024. EPA+DHA significantly reduced: revascularisation (RR 0.90), myocardial infarction (RR 0.89), cardiovascular death (RR 0.92). Effects greatest in participants on statins. EPA alone showed larger benefit than EPA+DHA combined across most endpoints.

Consumer-safe language: "EPA and DHA have been studied in clinical trials involving over 134,000 people and consistently show cardiovascular support."

Harris WS et al., J Clin Lipidology 2007 (PMID 17268413): 15–30% triglyceride reduction at 1–2g EPA+DHA/day in individuals with elevated baseline levels.

IMPORTANT NUANCE — COCHRANE REVIEW (2020)

A Cochrane systematic review found "little or no effect on mortality or cardiovascular health" from omega-3 supplementation in *general healthy populations*. Cardiovascular benefit is strongest in individuals with elevated triglycerides, established CVD, or high metabolic risk — the audience most likely buying Red Omega-3. Always frame benefits as "supports cardiovascular health" and target messaging at Persona 1 (borderline triglycerides, family history, over 40).

[Brain] Benefit 2: Brain & Cognitive Performance

Structural Foundation: DHA = 40% of Brain PUFA

Bazinet RP, Layé S, Nat Rev Neurosci 2014 (PMID 25284327): DHA comprises ~40% of all polyunsaturated fatty acids in the brain. It is incorporated into neuronal phospholipid membranes, directly determining membrane fluidity, synaptic receptor density, ion channel sensitivity, and neurotransmitter release efficiency. Chronically low DHA = rigid neuronal membranes = impaired signal transduction = reduced cognitive processing.

DHA also supports BDNF (brain-derived neurotrophic factor) — the protein governing neuroplasticity, memory formation, and adult neurogenesis. Low DHA is consistently associated with low BDNF in observational studies.

2022 Systematic Review: 9 RCTs, 1,319 Participants (PMID 36381743)

A systematic review of 9 RCTs (2010–2022) in Cureus confirmed: omega-3 supplementation improved working memory, episodic memory, and processing speed. Effects most pronounced in adults with lower baseline DHA levels — typical of India's high-omega-6 diet. DHA-dominant formulations produced the strongest cognitive results.

EPA and mood: A 2026 narrative review (MDPI) synthesising multiple meta-analyses confirmed EPA-dominant formulations (≥60% EPA) are effective adjuncts in major depressive disorder. Our 1.4:1 EPA:DHA ratio (743:528) is appropriately EPA-weighted for mood support alongside cognitive benefits.

[Inflammation] Benefit 3: Inflammation & Joint Recovery

The SPM Revolution (Serhan CN, Nature 2014 · PMID 25317992)

EPA and DHA are not just anti-inflammatory — they generate specialized pro-resolving mediators (SPMs): resolvins, protectins, and maresins. SPMs actively resolve inflammation by signalling immune cells to return to homeostasis — a fundamentally different and superior mechanism to NSAIDs, which only block inflammatory signals without resolving the underlying state.

This "resolution" mechanism is unique to omega-3 fatty acids and explains why consistent supplementation produces cumulative improvement over weeks of use — as SPM production builds with increasing EPA+DHA membrane incorporation.

Joint Evidence + Astaxanthin Synergy

Calder PC, Br J Clin Pharmacol 2013 (PMID 23441618): Multiple RCTs confirm EPA and DHA supplementation reduces joint tenderness, morning stiffness, and NSAID reliance in inflammatory joint conditions. Effects build over 6–12 weeks of consistent use.

Astaxanthin additive mechanism: Park et al., J Med Food 2010 (PMID 20038973): 4mg Astaxanthin independently reduces exercise-induced oxidative stress and muscle damage markers (CK, LDH). Astaxanthin inhibits NF-κB — the master transcription factor for inflammatory cytokines — through a completely different pathway than EPA. The combination is additive: EPA targets eicosanoids, Astaxanthin targets gene expression of inflammatory mediators.

[Eye] Benefit 4: Eye Health & Visual Protection

DHA: The Structural Eye Fatty Acid (SanGiovanni & Chew, 2005 · PMID 15555528)

DHA constitutes ~60% of PUFA in retinal photoreceptor outer segment membranes — the highest DHA concentration of any tissue in the body. It is essential for rhodopsin protein function (light transduction), photoreceptor membrane renewal, and visual signal propagation. DHA deficiency is directly linked to reduced photoreceptor renewal rate and increased vulnerability to oxidative damage from UV and blue light — both major stressors in India's screen-dominant urban population.

Astaxanthin: Direct Retinal Antioxidant

Astaxanthin crosses the blood-retinal barrier and accumulates directly in retinal tissue (documented in human and animal studies). It provides site-specific antioxidant protection to photoreceptors — quenching singlet oxygen and free radicals at the point of highest oxidative risk in the visual system.

Nakagawa K et al., Eur J Appl Physiol 2011: Astaxanthin supplementation improved visual accommodation and reduced asthenopia (eye strain) in subjects with prolonged screen exposure — highly relevant for India's urban office/tech workforce. **This combination of structural (DHA) + antioxidant (Astaxanthin) support for the retina is unique to Red Omega-3 in the Indian market.**

[Mood] Benefit 5: Mood & Mental Wellbeing

EPA, Neuroinflammation, and Mood (2026 Meta-Analysis Review)

A 2026 narrative review (MDPI, published Jan 2026) synthesising multiple meta-analyses confirmed that EPA-dominant omega-3 formulations — defined as ≥60% EPA of total EPA+DHA — consistently demonstrate antidepressant effects as adjuncts. The mechanism operates through two distinct pathways:

1. **Neuroinflammation reduction:** Elevated IL-6, TNF-alpha, and CRP (markers of systemic inflammation) are well-established biomarkers in major depression. EPA's anti-inflammatory action reduces this neuroinflammatory burden, improving the cellular environment for serotonin synthesis and receptor function.

2. **Membrane fluidity and serotonin:** DHA-enriched neuronal membranes have higher serotonin receptor density and more efficient serotonergic neurotransmission. The brain's ability to respond to serotonin is partly determined by membrane composition.

The India context: India's 20:1 omega-6:omega-3 ratio drives chronic neuroinflammation at population scale. This is a biological substrate for mood dysregulation that cannot be addressed by psychological interventions alone. Correcting the fatty acid ratio addresses this upstream cause.

Approved consumer language: "EPA supports the body's inflammatory balance, which plays a documented role in mood and emotional wellbeing."

CLINICAL EVIDENCE SUMMARY — FIVE BENEFITS, FIVE LEVELS OF EVIDENCE

BENEFIT	STRONGEST EVIDENCE	CONSUMER LANGUAGE (FSSAI SAFE)	NEVER SAY
[Heart] Heart Health	134,144-participant meta-analysis (2024); REDUCE-IT (2019, PMID 30415628)	"Supports cardiovascular health and helps maintain healthy triglyceride levels"	"Prevents heart attacks"
[Brain] Brain/ Cognition	9 RCTs, 1,319 participants (2022, PMID 36381743); DHA = 40% brain PUFA	"DHA supports brain function, memory, and cognitive health"	"Prevents dementia/ Alzheimer's"
[Inflammation] Inflammation/ Joints	SPM mechanism (Serhan 2014, PMID 25317992); Calder meta-analysis 2013	"Supports the body's natural anti-inflammatory response and joint comfort"	"Cures arthritis"
[Eye] Eye Health	DHA = 60% retinal PUFA (SanGiovanni 2005, PMID 15555528); Astaxanthin retinal accumulation	"DHA and Astaxanthin support visual health and retinal function"	"Improves eyesight / prevents macular degeneration"
[Mood] Mood/ Wellbeing	Multiple meta-analyses; EPA ≥60% formulas most effective (2026 review)	"EPA supports inflammatory balance which plays a role in mood and emotional wellbeing"	"Treats depression/ anxiety"

§ 05 · THE ASTAXANTHIN ADVANTAGE

India's First Red Omega-3

Why adding 4mg of natural Astaxanthin from Haematococcus pluvialis transforms a good fish oil into the most advanced omega-3 system available in India

ONE-LINER FOR DESIGNERS & SKIMMERS

"Astaxanthin doesn't just make the capsule red. It protects the omega-3 from the factory to your cell membranes — and then keeps protecting your cells from the inside. No other fish oil in India does this."

What Is Astaxanthin?

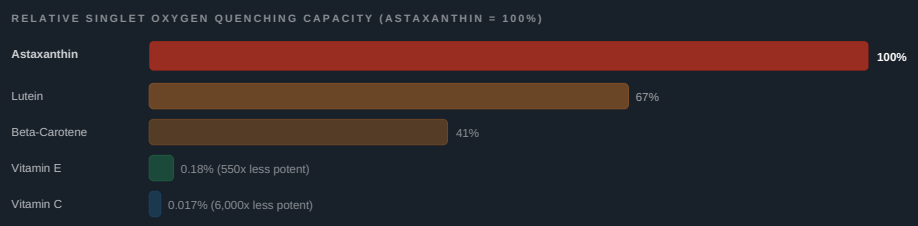
Astaxanthin is a xanthophyll carotenoid — a fat-soluble pigment produced by the microalgae *Haematococcus pluvialis* as a survival response to UV radiation and oxidative stress. It is the primary pigment responsible for the pink-red colouration of wild salmon, trout, and certain crustaceans. It is the most powerful antioxidant found in nature by singlet oxygen quenching capacity — 6,000x more potent than Vitamin C, 800x more potent than CoQ10, and 550x more potent than Vitamin E.

The natural Astaxanthin used in Red Omega-3 comes from *Haematococcus pluvialis* algae — the same strain used in clinically studied branded ingredients (AstaReal, AstaPure). This is categorically different from synthetic Astaxanthin (produced from petrochemical precursors), which has different stereochemical structure, different

bioavailability, different safety data, and is used in aquaculture, not human nutrition. Our Astaxanthin is nature-identical to what the algae produces under stress — the form the body recognises and uses.

DIAGRAM 5.1 — ASTAXANTHIN ANTIOXIDANT POTENCY: NATURE'S MOST POWERFUL MARINE CAROTENOID

Singlet oxygen quenching capacity vs. other antioxidants



Naguib YM, J Agric Food Chem 2000. Miki W, Pure Appl Chem 1991. All values relative to Astaxanthin singlet oxygen quenching capacity. Values approximate — source-dependent variation exists.

Three Levels of Astaxanthin Action — Why 4mg Is Not Just a Marketing Decision

[Glass Bottle]

Level 1: In-Bottle Protection

Astaxanthin is fat-soluble and distributes itself throughout the oil matrix at the molecular level. It intercepts free radical chain reactions before they propagate through the EPA and DHA molecules — functioning as a continuous antioxidant shield from the moment of encapsulation through storage, transit, and shelf life. This is the mechanism that keeps Red Omega-3's EPA and DHA intact, potent, and non-oxidized when you open the bottle. No other antioxidant addition (Vitamin E, rosemary extract) achieves this with the

[Science]

Level 2: In-Body Membrane Protection

After absorption, Astaxanthin is incorporated into cell membranes alongside EPA and DHA — where it continues to quench free radicals and singlet oxygen *in situ*. This is functionally unique: most antioxidants (Vitamin C, polyphenols) are water-soluble and cannot access lipid membrane compartments. Astaxanthin's amphipathic molecular structure allows it to span the full width of the lipid bilayer, protecting both the inner and outer surfaces simultaneously. It

*

Level 3: Independent Systemic Benefits

At 4mg — the clinically studied dose range for multiple endpoints — Astaxanthin provides independent benefits that synergise with the omega-3 components: significant reduction in exercise-induced oxidative stress and muscle damage (Park et al. 2010), improved skin elasticity and UV protection (Tominaga et al. 2012), reduced CRP and IL-6 (direct anti-inflammatory, additive to EPA), macular protection (DHA + Astaxanthin: the two most important macular nutrients

same potency at the same low dose.

protects the EPA and DHA it was shipped with — at the cellular destination.

combined), and improved endurance and recovery metrics. These benefits exist independently of omega-3 — Astaxanthin earns its place beyond just protecting the oil.

DIAGRAM 5.2 — WHY ASTAXANTHIN MAKES THE RED OMEGA-3 SYSTEM MORE THAN THE SUM OF ITS PARTS

The three-layer protection and synergy model

LAYER 1: IN-BOTTLE PROTECTION (Manufacturing → Storage → Shelf)
Astaxanthin dissolved in oil matrix → singlet O_2 quenching → free radical chain termination → EPA and DHA protected from peroxidation
Result: Product arrives at consumer membrane-intact, non-rancid, with full EPA+DHA bioactivity preserved

LAYER 2: IN-BODY MEMBRANE PROTECTION (Post-Absorption → Cell Membrane)
EPA + DHA incorporated into phospholipid bilayer → Astaxanthin co-localises in same membrane → amphipathic protection spanning full bilayer width
Result: Cellular omega-3 is protected from in vivo oxidation — sustaining membrane fluidity, receptor function, and eicosanoid production capacity

LAYER 3: INDEPENDENT SYSTEMIC BENEFITS (4mg clinical dose range)
↓ CRP · ↓ IL-6 (synergises with EPA) · ↓ exercise oxidative stress · ↑ skin elasticity · Macular protection (synergises with DHA)
Result: Astaxanthin earns its dose beyond protection — cardiovascular, visual, and anti-inflammatory effects in its own right

COMBINED RESULT: EPA + DHA + Astaxanthin = India's Most Complete Marine Omega-3 System

Park et al., J Med Food 2010 — Astaxanthin reduces exercise-induced oxidative damage. Nakagawa et al., Eur J Appl Physiol 2011. Tominaga et al., Acta Biochim Pol 2012 — skin elasticity. Naguib 2000 — antioxidant potency.

WHY "INDIA'S FIRST RED OMEGA-3" IS NOT JUST A MARKETING CLAIM

The red colour of the capsule is direct physical evidence of Astaxanthin content — it is chemically impossible to have a red softgel without Astaxanthin present in meaningful concentration. Every other fish oil capsule in the Indian market is pale yellow — indicating no Astaxanthin. Red Omega-3 is visually, structurally, and scientifically different from everything in the category. The colour is proof, not packaging. And "India's First" is accurate as of March 2026: no other Indian omega-3 product combines Natural TG fish oil with clinical-dose natural Astaxanthin from H. pluvialis in an enteric-coated softgel.

✍️ CONTENT TEAM — SECTION 5

The red capsule visual is your single most powerful social content asset. "Every other fish oil capsule is yellow. Ours is red. Here's why that matters." is the highest-engagement hook available because it demands curiosity and explains itself through colour. The "antioxidant that protects itself" angle is completely unoccupied by any competitor. The "most powerful marine antioxidant in nature" positioning for Astaxanthin (6,000x stronger than Vitamin C) is a scientifically defensible claim that will drive enormous share — use always with "by singlet oxygen quenching capacity" qualifier.

- Visual: Red vs Yellow capsule side by side — the simplest possible category differentiation image
- Science story: "What makes your fish oil capsule red? And why does colour matter?" — flagship explainer
- Antioxidant potency: "6,000x stronger than Vitamin C. It's the reason our capsule is red." — awareness Reel
- Protection narrative: "Most fish oil protects your heart. Ours also protects itself." — conversion hook

§ 06 · SYNERGY DEEP DIVE

The EPA + DHA + Astaxanthin Synergy Map

Why three marine molecules working together produce a biological result that none of them achieves alone — and why this makes Red Omega-3 a fundamentally different product from anything else in the category

ONE-LINER FOR DESIGNERS & SKIMMERS

"Three marine molecules. Three distinct mechanisms. One fully integrated anti-inflammatory, neuroprotective, antioxidant system — from the bottle to your cell membranes."

DIAGRAM 6.1 — THREE-MOLECULE SYNERGY COVERAGE MATRIX

Which molecule covers which biological system — and where they amplify each other

	EPA	DHA	ASTAXANTHIN	SYNERGY NOTE
♥ **Cardiovascular** TG ↓ · BP ↓ · Arrhythmia ↓	●●	●	●	EPA+Asta: dual CRP reduction · Synergistic
△ **Anti-Inflammatory** Eicosanoids · Resolvins · CRP	●●	●	●●	EPA (COX/LOX) + Asta (IL-6 ↓) = additive
◉ **Brain & Cognition** BDNF · Neuroplasticity · Memory	●	●●	●	DHA + Asta: dual neuroprotection

● Primary role ●● · ● Secondary ● · ● Minimal contribution

Matrix represents mechanistic roles based on published literature. Calder 2013, Park 2010, Naguib 2000, Bhatt 2019. All synergy notes are mechanism-based — see §15 for validation status.

The Anti-Inflammatory Cascade — Why EPA + Astaxanthin Produces Additive Effects

EPA reduces systemic inflammation by shifting eicosanoid production at the COX/LOX enzyme level — reducing PGE2, LTB4, and producing resolvins and protectins. Astaxanthin independently reduces inflammation by a completely different mechanism: direct inhibition of NF-κB (nuclear factor kappa-light-chain-enhancer of activated B cells) — the master transcription factor that drives production of pro-inflammatory cytokines including IL-1β, IL-6, TNF-alpha, and COX-2 expression itself. These two mechanisms do not compete — they are additive. EPA reduces the inflammatory signal *output*. Astaxanthin reduces the inflammatory gene *expression*. Together they represent a dual-pathway anti-inflammatory system that single-molecule fish oil cannot replicate.

The Eye Health Combination — The Two Most Important Macular Nutrients in One Capsule

DHA accounts for 60% of all polyunsaturated fatty acids in the retinal photoreceptor membranes — it is the primary structural lipid of the visual system. Astaxanthin is, independently, one of the most clinically studied nutraceuticals for macular and retinal protection — it crosses the blood-retinal barrier and accumulates directly in retinal tissue, where it provides antioxidant protection to photoreceptors against UV-induced and oxidative damage. The combination of DHA + Astaxanthin in a single serving means Red Omega-3 delivers two of the most important retinal support nutrients simultaneously — a combination that would otherwise require two separate supplements.

[BRAIN] COGNITIVE SYNERGY: DHA + ASTAXANTHIN

DHA supports neuronal membrane structure and BDNF expression — the growth factor for new neural connections. Preclinical research suggests astaxanthin may cross the blood-brain barrier, where it could reduce neuroinflammation and protect neuronal mitochondria against oxidative damage. The combination provides both the structural substrate for healthy neurons (DHA) and antioxidant support for those same neurons (Astaxanthin) — simultaneously.

[STRENGTH] RECOVERY SYNERGY: EPA + ASTAXANTHIN

Post-exercise inflammation is mediated by both eicosanoid production (EPA's target) and reactive oxygen species (ROS) accumulation from mitochondrial stress (Astaxanthin's target). Clinical trials with Astaxanthin show significant reductions in exercise-induced muscle damage markers (creatine kinase, lactate dehydrogenase), independent of omega-3. Combined with EPA's LTB4 suppression, Red Omega-3 provides dual-mechanism recovery support — the most complete marine recovery stack available in India.

✍️ CONTENT TEAM — SECTION 6

The consumer-facing version of this section is powerful as Q&A content. "Why does Red Omega-3 contain Astaxanthin?" → "Because Astaxanthin protects the omega-3 you're swallowing AND provides its own anti-inflammatory and antioxidant effects through completely different mechanisms." The "two most important eye health nutrients in one capsule" angle is extremely high-value for the 40+ audience and the screen-overexposed urban professional. Never frame these as separate benefits — always frame as a system. "Three marine molecules. One system."

- The "two anti-inflammatory pathways" explainer — highest science credibility content piece in the portfolio
- Eye health combo: "If you care about your eyes, DHA and Astaxanthin are the two nutrients you need. We put both in one capsule." — dedicated PDP section and A+ module
- Synergy matrix (Diagram 6.1): For website "How It Works" section and Amazon A+ Module 3

§ 07 · DELIVERY TECHNOLOGY

Natural TG + Enteric Coating Technology

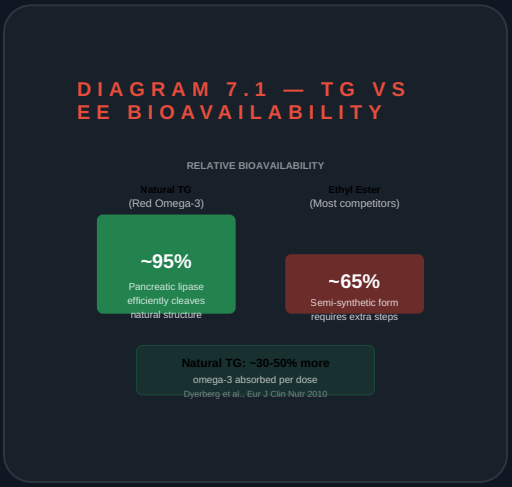
The delivery system engineered for maximum bioavailability — not manufacturing convenience

ONE-LINER FOR DESIGNERS & SKIMMERS

"Natural TG form means your body recognises and absorbs it like food. Enteric coating means it reaches your intestine intact — without the oxidation, GI distress, or fishy reflux that tells you standard fish oil is failing."

① Natural Triglyceride (TG) Form

Fish oil omega-3 exists in three commercially available molecular forms: natural triglycerides (TG), ethyl esters (EE), and re-esterified triglycerides (rTG). Each has dramatically different bioavailability, digestibility, and processing requirements.



Natural Triglyceride form is exactly what its name implies — EPA and DHA still in their original molecular structure as found in fish tissue, bonded to a glycerol backbone in the standard triglyceride configuration. This is the form the human body evolved to recognise, absorb, and process. Pancreatic lipases cleave the fatty acids from the glycerol backbone during digestion — the same mechanism used for all dietary fats since the origin of human metabolism. The result is efficient absorption requiring no unusual enzymatic steps.

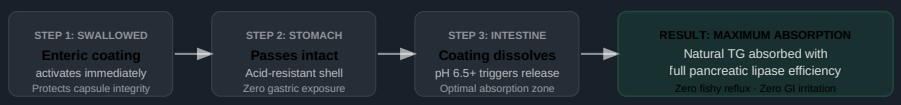
Ethyl Ester form — used by the majority of concentrated fish oil products globally — is a semi-synthetic form created by

transesterification: ethanol replaces the glycerol backbone. This industrial process concentrates omega-3 percentage but creates a molecule that human pancreatic lipases hydrolyse 3–4x less efficiently than natural TG. Published bioavailability studies consistently show Natural TG form absorbs 30–50% more omega-3 per dose than equivalent EE products.

② Enteric Coating — Why No Fishy Burps Is a Bioavailability Claim, Not a Comfort Claim

The enteric coating on Red Omega-3 softgels is not a premium feature designed to make fish oil more palatable. It is a delivery architecture decision with direct implications for omega-3 bioavailability and product stability.

DIAGRAM 7.2 — ENTERIC COATING JOURNEY: FROM MOUTH TO MAXIMUM ABSORPTION



Standard softgels dissolve in the stomach (pH 1.5–3.5) → fish oil contacts gastric acid → partial oxidation + GI irritation + fishy eructation. Enteric-coated softgels bypass the stomach entirely. Dissolution occurs in the duodenum/jejunum (pH 6.5+) — the primary omega-3 absorption site.

When a standard fish oil softgel reaches the stomach, the gelatin shell dissolves in highly acidic gastric fluid (pH 1.5–3.5). Fish oil — already partially oxidized in many cases — is now exposed to additional oxidative stress in a warm, oxygen-present, acid environment. The result is fishy eructation (the "fish burp" that signals the capsule has dissolved in the stomach rather than the intestine), potential gastric irritation, nausea, and partial degradation of EPA and DHA before they even reach the absorption site.

Red Omega-3's enteric coating resists gastric acid. The softgel passes through the stomach completely intact, dissolving only when it reaches the duodenum and jejunum at pH 6.5 or above — the primary site of fatty acid absorption in the small intestine. There is no stomach contact. No fishy smell. No GI irritation. And critically — the omega-3 reaches the optimal absorption environment fully intact, with Astaxanthin protection still active in the oil matrix.

③ Peppermint Extract — The Second Layer of Freshness

Red Omega-3 addresses the fishy burp problem with a two-mechanism approach that no competitor matches with both simultaneously:

[Capsule]

Layer 1: Enteric Coating (Structural)

The capsule physically bypasses the stomach — the source of the fishy reflux — entirely. The omega-3 never meets gastric acid. This eliminates the root cause of fishy burps: stomach dissolution.

[Mint]

Layer 2: Peppermint Extract (Sensory + GI)

Natural peppermint extract is blended into the softgel formulation. Peppermint's menthol acts on GI smooth muscle receptors (CCK-A), reducing cramping and gut motility issues. It also provides a clean, fresh aftertaste that replaces any residual fish odour. Even if a small amount of oil reaches the stomach environment, peppermint ensures the sensory experience remains pleasant.

WHY BOTH MATTER — THE COMPETITIVE EDGE

Ace Blend uses peppermint only — no enteric coating. Wellbeing Nutrition uses peppermint only (except for their 6x Ultra which adds enteric coating but not peppermint for the same sensory effect). Red Omega-3 is the only product that combines structural stomach bypass (enteric coating) with sensory freshness (peppermint extract) — making it the most comprehensively burp-free omega-3 in India.

In consumer language: *"The enteric coating is your backup goalkeeper. The peppermint is the clean sheet. Together, there's simply nothing unpleasant to experience."*

④ Glass Bottle in Paper Canister

Glass is chemically inert — it does not interact with the omega-3 oils stored within it, does not leach plasticizers (BPA, phthalates) under heat, and provides a genuine light-barrier for oxidation protection. Plastic

containers are oxygen-permeable over time and documented to leach endocrine-disrupting plasticizers into oil-based products under storage heat conditions. The paper canister provides UV protection and creates a premium unboxing experience. No direct Indian omega-3 competitor uses this combination at this price point.

Bioavailability Deep Dive

Bioavailability is the percentage of omega-3 that actually reaches your bloodstream and cells. In fish oil, this single variable determines whether a product works or just costs money.

Red Omega-3 is designed to maximise bioavailability at every step of the absorption chain through three compounding decisions: Natural TG molecular form + Enteric coating release site + High omega-3 concentration at 77% of oil. Most products get one of these right. We get all three.

DIAGRAM 8.1 — THE FOUR BIOAVAILABILITY FACTORS: HOW RED OMEGA-3 OPTIMISES ALL FOUR

The factors that determine how much omega-3 you absorb vs. excrete

FACTOR 1 Molecular Form	FACTOR 2 Release Site	FACTOR 3 Concentration	FACTOR 4 With-Meal Dosing
TG	**Intestine**	**~77%**	**Fed State**
Natural Triglyceride	Enteric coating	Omega-3 of total oil	Take with largest meal
Pancreatic lipase-optimal substrate	Bypasses stomach pH 6.5+ release	1,271mg EPA+DHA from 1,650mg fish oil	Bile salts maximised Lipase activity optimal
~30-50% ↑ vs EE	**Optimal absorption zone**	**2-4x standard products**	**Up to 3x vs fasted state**
Dyerberg 2010	No GI distress · No fishy burp	Eurofins verified	Raatz et al., 2009

Dyerberg J et al., Eur J Clin Nutr 2010 — TG vs EE bioavailability comparison. Raatz SK et al., J Nutr 2009 — fed vs fasted absorption of fish oil. Eurofins reports for concentration data.

PLAIN LANGUAGE SUMMARY — THE BIOAVAILABILITY ADVANTAGE

Most fish oil products give you the dose on the label. Very little of it actually arrives in your cells. Ethyl ester form absorbs ~30% less efficiently than what we use. Standard release in the stomach causes partial oxidation and GI loss. Low concentration means you're swallowing mostly non-omega-3 oil. Red Omega-3 optimises every step: Natural TG form that absorbs like food, enteric coating that delivers to the optimal site intact, and 77% omega-3 concentration so the dose you take is the dose that works.

§ 09 · CUSTOMER SEGMENTS

The Five Customer Personas

Who buys Red Omega-3, what they feel, what they search, and exactly how to talk to each of them

HOW CRM & MARKETING TEAMS USE THIS SECTION

Each persona maps to a distinct content angle, CRM sequence, and ad creative. Use these to segment your email and WhatsApp lists, personalise sequences, and write platform-specific content. Pain point language is drawn from actual search patterns and common supplement review language — use it verbatim in headlines wherever possible.

Heart]

The Heart-Conscious Professional

Persona 01 · Largest Segment · ~35% of Buyers · Primary Benefit: Cardiovascular Health

THEIR PAIN IN THEIR OWN WORDS

"My doctor told me my triglycerides are borderline high and I should consider fish oil. I'm only 42 — this is a wake-up call. I've had two family members with heart issues. I want to be proactive but I don't know which fish oil is actually worth taking or what dose even works."

WHAT THEY SEARCH

"best fish oil for triglycerides India" · "omega 3 for heart health dose" · "EPA DHA cardiovascular" · "fish oil how much per day" · "omega 3 for cholesterol India 2025"

HOW TO TALK TO THEM

Lead with the clinical dose story — they want to know the dose works. Open with: "Most fish oil doses are too low to do anything. Here's what the research actually requires." Reference the REDUCE-IT trial (Bhatt et al., NEJM 2019) as landmark cardiovascular evidence for EPA specifically —

note that REDUCE-IT used 4g/day and our dose positions meaningfully within the clinically studied range. The Eurofins verification closes the trust gap. Age: 38-55 · Urban India · Working professional

Brain]

The Cognitive Performer

Persona 02 · High Value · ~20% of Buyers · Primary Benefit: Brain & Mental Performance

THEIR PAIN IN THEIR OWN WORDS

"I work 10-12 hours a day on a screen. My focus isn't what it was at 28. I get mental fatigue by 3pm. I've been reading about DHA and brain health and I want to be doing everything I can to protect my cognition long-term. I'm willing to pay for something that actually works."

WHAT THEY SEARCH

"omega 3 for brain health" · "DHA for concentration" · "best supplement for cognitive performance India" · "fish oil nootropic" · "DHA BDNF neuroplasticity" · "omega 3 mental clarity"

HOW TO TALK TO THEM

Lead with DHA + BDNF + neuroplasticity. They're supplement-literate — don't oversimplify. "DHA is 40% of your brain's polyunsaturated fatty acids. Your brain can't make it. Are you giving it enough?" The Astaxanthin-crosses-blood-brain-barrier angle is extremely high-value for this persona. Age: 28-45 · Urban India · High cognitive demand job

trength]

The Active Recoverer

Persona 03 · High Value · ~20% of Buyers · Primary Benefit: Inflammation & Recovery

THEIR PAIN IN THEIR OWN WORDS

"I train 5 days a week and my joints are starting to feel it. My knees ache after leg day. Recovery is slower than it used to be.

WHAT THEY SEARCH

"omega 3 for joint pain India" · "fish oil for inflammation gym" · "EPA LTB4 joints" · "best omega 3 for athletes India" ·

HOW TO TALK TO THEM

Lead with recovery. EPA→LTB4 suppression is the most relevant mechanism. The EPA + Astaxanthin dual anti-

My coach mentioned omega 3 for inflammation. I want something that actually has a clinical dose — not the 300mg stuff they sell everywhere."

"omega 3 recovery supplement" · "anti-inflammatory supplement workout"

inflammatory story resonates strongly: "Two anti-inflammatory mechanisms. EPA targets the eicosanoid pathway. Astaxanthin targets NF-κB. Together they're the most complete marine recovery stack available in India." Age: 24-42 · Gym-going · Supplement-literate

[Eye]

The Health Optimizer 45+

Persona 04 · High Retention · ~15% of Buyers · Primary Benefit: Longevity & Eye Health

THEIR PAIN IN THEIR OWN WORDS

"I'm 50 and I want to be doing everything I can to stay healthy. My eyes have been getting dry and I've been reading about macular degeneration. I take my health seriously and I want the best version of omega 3 available — not some generic capsule. The red colour actually reassures me something different is going on."

WHAT THEY SEARCH

"omega 3 eye health DHA" · "best fish oil for macular health India" · "astaxanthin eye supplement" · "omega 3 for age 50" · "DHA retina macular protection" · "natural astaxanthin supplement India"

HOW TO TALK TO THEM

Lead with the eye health story. "DHA makes up 60% of the lipids in your retinal photoreceptors. Astaxanthin crosses the blood-retinal barrier and protects them directly. This combination doesn't exist in any other Indian supplement." The glass bottle and premium packaging strongly converts this persona. Age: 45-65 · Health-conscious · Reads ingredient labels

[Eye]

The Screen-Dependent Professional

Persona 05 · Fast-Growing Segment · ~15% of Buyers · High Lifetime Value · Primary Benefit: Eye Health + Cognitive Performance

THEIR PAIN IN THEIR OWN WORDS

WHAT THEY SEARCH

HOW TO TALK TO THEM

"I'm on my laptop 9-10 hours a day and my phone for another 3. My eyes are constantly dry and tired by 4pm. I've started getting headaches that I never used to. My vision is fine at the optician's but my eyes just... struggle. I've read that DHA is important for eye health and astaxanthin is supposed to help. But I can't find a product that has both."	"omega 3 for eye strain India" · "DHA for eye health" · "astaxanthin eye supplement" · "dry eyes supplement screen" · "best supplement for computer eyes India" · "omega 3 for screen workers"	Lead with the screen time reality: "Your retina is 60% DHA. You spend 12+ hours a day exposing it to blue light. What are you giving it?" The DHA + Astaxanthin eye protection combo is the ONLY product in India that addresses both the structural need (DHA for photoreceptors) and the oxidative protection (Astaxanthin crosses the blood-retinal barrier) in one capsule. Age: 25-45 · Urban India · High screen use · Tech/finance/ consulting sectors

✍️ CRM & MARKETING — PERSONA APPLICATION + PERSONA 5 NOTE

The Urban Wellness Woman (Persona 5) replaces the Caring Gifter because she is a larger, higher-LTV segment with consistent repurchase behaviour and very high referral rates in the beauty/wellness space. She drives Instagram and Pinterest content. She is the persona most likely to post an unboxing of the red capsule in glass bottle — which is organic marketing gold. The Caring Gifter angle can be activated seasonally (Diwali, Valentine's) as a campaign overlay without needing its own permanent CRM sequence.

- Build 5 separate email/WhatsApp sequences, one per persona. Welcome survey: "What's your primary reason for taking Red Omega-3?" — 5 options mapped to personas.
- Meta ads: Heart angle (P1), Brain angle (P2), Recovery angle (P3), Longevity/Eye angle (P4), Skin/Beauty angle (P5)
- Persona 5 content: "Omega-3 is the best skin supplement you're not taking" — owns an underserved content vertical in Indian supplement market
- Seasonal overlay: Gift-angle content for Diwali/Valentine's/Mother's Day without a dedicated CRM sequence

§ 10 · USAGE PROTOCOL

Usage, Dosing & Timing Protocol

When to take it, how to take it, what to expect — and why the protocol matters as much as the formula

ONE-LINER

"The best omega-3 taken at the wrong time absorbs significantly less well. The protocol below maximises every element of what Red Omega-3 delivers."

[Capsule]

Dose

2 Softgels

Take both together. The formula delivers one complete serving at 2 softgels — 743mg EPA + 528mg DHA + 4mg Astaxanthin.

?

With Meals

With your largest meal

Fat-soluble nutrients absorb 3x better in the fed state when bile salt secretion and lipase activity are maximal. Lunch or dinner both work. Do not take fasted.

?

With Water

Full glass of water

250ml minimum. Adequate fluid supports gastric motility and helps the enteric-coated softgel pass through the stomach to the small intestine quickly.

?

Frequency

Daily, consistently

Omega-3 builds in cell membranes over 4–6 weeks of daily dosing. Missing days resets the accumulation curve. Consistency is the mechanism — not a suggestion.

What to Expect and When

Omega-3 is not an acute supplement — it does not produce an immediate noticeable effect. It is a membrane remodelling supplement. The EPA and DHA you consume today are progressively replacing the omega-6-dominated fatty acid composition of your cell membranes over 4–12 weeks of consistent daily use. Setting the right expectation is the most important retention lever available.

1

Days 1–7: Membrane Remodelling Begins

EPA and DHA are incorporated into circulating phospholipids immediately. Erythrocyte membrane composition begins shifting within days. Most users will not notice any dramatic change in Week 1 — this is completely normal and expected. The biology is working; the effects are subcellular and accumulating. Astaxanthin levels in plasma peak within 24 hours and

maintain with daily dosing. Some users notice reduced post-meal heaviness or bloating (GI anti-inflammatory effect of EPA).

2

Weeks 2–4: Early Functional Changes

The omega-6:omega-3 ratio in cell membranes begins measurably improving. Users engaged in physical activity typically notice the first signs: reduced joint stiffness, faster recovery, less post-exercise soreness. The joint and inflammation benefits of EPA manifest before the cognitive benefits because musculoskeletal tissue turnover is faster than neuronal membrane remodelling. Dry eyes and skin may improve. Some users report mood improvements in this window — consistent with EPA's serotonin receptor modulation effects.

3

Week 4–8: Cardiovascular and Cognitive Benefits Emerge

Triglyceride reduction is typically measurable at 4–8 weeks — clinical research at doses similar to Red Omega-3 shows reductions in the range of 15–30% in individuals with elevated baseline triglycerides. (Larger reductions of 20–50% are documented at 2–4g/day EPA+DHA in clinical trials; results depend on baseline levels and consistency.) Cognitive effects begin emerging as DHA membrane incorporation reaches functionally significant levels in neural tissue. Energy, mental clarity, and sustained focus improvements become more noticeable. For Persona 4 (45+ health optimisers), the cardiovascular markers your doctor checks will start showing movement at this stage if you're testing.

4

Month 3+: Full Benefit Window · Ongoing Protection

Full membrane EPA and DHA incorporation is complete. The anti-inflammatory, neuroprotective, and cardiovascular effects are now operating at maximum efficacy. The research evidence for omega-3's long-term protective effects — macular degeneration risk reduction, sustained cognitive performance, cardiovascular event risk reduction — applies at this stage with consistent daily use. This is not a 30-day supplement. It is a lifelong daily health practice.

Who Can Take It

- ✓ Adults 18+ in good general health
- ✓ Safe for vegetarians (fish gelatin softgel — confirm if relevant for your consumer; if fish gelatin, suitable for non-vegetarians)
- ✓ Suitable for long-term daily use at 2-softgel dose
- ✓ 1,271mg EPA+DHA is within safe intake ranges for healthy adults
- ✓ Compatible with most common supplements and medications
- ✓ Safe alongside statins (omega-3 often co-prescribed with statins for triglycerides)

Consult Your Doctor If

- ✓ You are on blood-thinning medication (warfarin, aspirin, clopidogrel) — high-dose omega-3 has mild anticoagulant effects
- ✓ You are scheduled for surgery — discontinue 1 week prior
- ✓ You are pregnant or breastfeeding (not contraindicated but medical supervision recommended)
- ✓ You have a fish or shellfish allergy
- ✓ You are already taking high-dose omega-3 prescription medication (e.g. Vascepa/icosapentaenoic acid)

Competitive Benchmarking

Full analysis based on live product data as of March 2026 — with the truth about who is actually competing and where the real differentiation sits

⚠ INTERNAL USE ONLY · STRICTLY CONFIDENTIAL · DO NOT SHARE EXTERNALLY

This section contains named competitor analysis. **It must never leave the organisation under any circumstance.** If this dossier is shared with a content agency, freelancer, or designer, §11 must be removed entirely first. Competitor names, specific price comparisons, quality assertions about named brands, and campaign targeting strategies are for internal strategic use only.

For external collaborators: Use the sanitised Operational Brand Dossier. All competitor references in that document are replaced with generic labels ("primary competitor," "standard market product") with no specific claims about quality, formulation, or pricing.

Legal reminder: Any assertion about a named competitor's product quality, formulation, or testing that cannot be independently verified creates legal exposure. The competitive intelligence in this section is for internal positioning strategy only — it must never appear in advertising, social content, or any public-facing communication.

THE MOST IMPORTANT COMPETITIVE FACT — READ THIS FIRST

Ace Blend Outshine has the IDENTICAL formulation numbers: 1650mg fish oil, EPA 743mg, DHA 528mg per serving. They also claim "4x Strength." They also use peppermint for no fishy burps. Their 60-cap bottle retails at approximately ~₹1,399 (Flipkart, verify) — which is ₹15 cheaper per serving than Red Omega-3. This is the primary competitive threat and it changes the entire marketing strategy. The story can no longer be about dose or peppermint alone. It must be about what Ace Blend doesn't have: **Astaxanthin, Glass bottle, Eurofins verification, Natural TG form specified, Enteric coating.**

The Real Landscape — Verified Data Only

BRAND / PRODUCT	FISH OIL	EPA	DHA	OMEGA-3 CONC.	FORM	ADD-INS	₹/SERVING	ASTAXANTHIN	GLASS	EUROFINS	ENTERIC

Neuherbs Triple	2,500mg	892mg	594mg	~59%	Not specified	Vitamin D3 + Lemon	~₹30	✗	✗	✗	✗

Competitor 01 — The Direct Battle: Ace Blend Outshine

Ace Blend Outshine Omega-3 · EPA 743mg · DHA 528mg · ~₹1,399 (Flipkart, verify) / 60 caps (~₹47/serving (verify))

The hard truth: Ace Blend is the most dangerous competitor because they have identical EPA/DHA numbers, also claim "4x Strength," also use peppermint for no fishy burps, and are ₹15 cheaper per serving. On any straightforward dose comparison, they match us exactly. They have also received a 10/10 label accuracy score from Unbox Health (independent testing platform). On raw omega-3 dosing, this is a tie.

Where they lose:

[Red] **No Astaxanthin.** Their capsules are yellow. Ours are red. This single visible difference is the most powerful brand story in the category — and they cannot match it without reformulating.

[Glass Bottle] **Plastic bottle.** Fish oil + plastic + India's heat + humidity = documented oxidation risk. We use glass.

[Science] **No Eurofins verification at our level.** Unbox Health is a domestic platform with a single test. Eurofins operates in 60+ countries with ISO/IEC 17025:2017 accreditation. Different standard entirely.

[Formula] **Form not specified.** They don't publicly confirm Natural TG form. We do — and we have Eurofins reports to back it.

[Capsule] **No enteric coating.** Standard softgels dissolve in the stomach. Ours pass through intact and dissolve in the small intestine — the optimal absorption site.

[Protection] **No oxidation protection story.** Their oil has no documented antioxidant protection in the matrix. Red Omega-3's Astaxanthin provides continuous antioxidant protection — from encapsulation through storage through absorption. That story is ours alone.

Our counter-narrative: "Both products start with the same clinical dose. But only one of them protects it — from the factory to your cells. Same 4x strength. Completely different level of quality assurance."

Competitor 02 — The Volume Brand: Wellbeing Nutrition (Multi-SKU)

WBN Slow Range — 3x (₹999), 4x (₹1,333), 6x Ultra (~₹1,850) · 60 caps each

Their story: Strong brand equity. Differentiator is Curcumin (95% curcuminoids) added as an anti-inflammatory co-ingredient. Natural TG form (confirmed). Multiple SKUs at different price/strength points. Their 6x Ultra is the serious threat — 1,080mg EPA + 800mg DHA = meaningfully higher dose than ours, also enteric coated, also TG form (rTG). If a consumer compares WBN 6x vs Red Omega-3 on dose alone, WBN 6x wins on EPA/DHA numbers.

Their weaknesses across all SKUs: No Astaxanthin in any SKU. No glass packaging. No Eurofins-level independent verification. The Curcumin they add is an anti-inflammatory addition but it's not an oxidation protection story — it doesn't protect the oil in the capsule. Their 3x and 4x are lower dose than ours. The 6x is higher dose but significantly more expensive.

Counter on WBN 6x: "More EPA/DHA, no antioxidant protection, no glass, no Eurofins, and ₹600 more expensive. If the oil arrives degraded — which Curcumin can't prevent — more of it doesn't help."

Counter on WBN 3x/4x: "Lower dose, lower concentration, no Astaxanthin. Curcumin is a good addition — but it doesn't protect what's inside the capsule. Red Omega-3 does."

Competitor 03 — The Krill Category: Miduty

Miduty Antarctic Krill Oil (with Astaxanthin) · ~₹1,200 / 60 caps · Different category

Why they're not the same: Miduty's product is krill oil — a completely different source (Antarctic krill, not fish). Krill oil contains omega-3 in phospholipid form (not TG), which has different absorption characteristics. Importantly, krill oil naturally contains Astaxanthin (from the krill itself), but at much lower EPA+DHA concentrations per capsule. The serving size is 1 softgel (not 2), and the EPA/DHA per serving is substantially lower than Red Omega-3. Founder-led brand (Palak Midha) with strong community trust.

Counter: "Krill oil and fish oil are different products for different needs. If someone specifically wants krill's phospholipid form, they're a different buyer. Our buyer wants clinical-dose EPA and DHA — which krill oil cannot match at equivalent cost."

Red Omega-3 Rights-to-Win — The Moat

ADVANTAGE	WHAT IT MEANS	WHO CAN MATCH IT?
[Red] Natural Astaxanthin 4mg	The red capsule. In-oil protection. In-body protection. Independent antioxidant and anti-inflammatory benefits. Visually proves quality before the bottle is opened.	No fish oil competitor in India. Miduty (krill) has some astaxanthin but it's different form, lower dose, much lower EPA/DHA. **This is a complete moat.**
[Glass Bottle] Glass Bottle + Paper Canister	Zero plastic contact with oil. Chemically inert. No BPA/phthalate leaching risk. Premium unboxing experience that converts gifting buyers and quality-conscious shoppers at first sight.	Zero competitors in the Indian fish oil category use glass. Ownable until copied.
[Science] Eurofins Verified (ISO/IEC 17025:2017)	Two accredited reports confirming EPA 45.06g/100g and DHA 35.03g/100g — lab we don't own, internationally accredited, published publicly. Ace Blend has Unbox Health (domestic, single test). WBN has no visible independent verification at this standard.	No direct competitor can claim Eurofins accredited reports published at this specificity without investing in the same testing.
[Capsule] Enteric Coated	Capsule passes through stomach intact. Dissolves in small intestine. Zero fishy burp. Optimal absorption site. Ace Blend uses standard softgels. WBN 3x/4x standard softgels. Only WBN 6x Ultra also has enteric coating.	WBN 6x has it — but at ₹62/serving vs our ₹48.
[Formula] Natural TG Form (Confirmed)	Ace Blend does not specify their molecular form. WBN confirms TG for 3x/4x and rTG for 6x. We confirm Natural TG — and have Eurofins capsule weight data consistent with high-quality TG oil characteristics.	WBN also claims TG — but without Eurofins backing. Ace Blend's form is unverified.
[Mint] Peppermint Extract	Dual-action no-fishy-burp system: enteric coating (bypasses stomach) + peppermint extract (soothes GI) = most comprehensive fishy-burp prevention in the category. Ace Blend only has peppermint. We have both.	Ace Blend and WBN have peppermint. Only Red Omega-3 combines enteric coating AND peppermint.

THE ONE-LINE COMPETITIVE SUMMARY FOR EVERY BRIEFING

"Ace Blend has the same 4x dose. We have the same 4x dose PLUS Astaxanthin that protects it, PLUS a glass bottle that stores it properly, PLUS Eurofins that verifies it, PLUS enteric coating that delivers it optimally. Same starting point. A fundamentally different product."

§ CLINICAL EVIDENCE SUMMARY

The Clinical Evidence Behind Every Claim

Specific peer-reviewed clinical trials — not general mechanism claims — for each benefit area. These are the studies that justify the science.

[Heart] Heart & Cardiovascular Health

STUDY	WHAT THEY DID	WHAT THEY FOUND	RELEVANCE TO RED OMEGA-3
REDUCE-IT Bhatt et al., NEJM 2019 PMID 30415628	8,179 patients with elevated TG on statins. 4g/day icosapentaenoic acid (EPA) vs placebo. 4.9 year follow-up.	25% relative risk reduction in major adverse cardiovascular events. 20% reduction in cardiovascular death.	Landmark evidence that high-dose EPA drives cardiovascular protection. Our 743mg EPA per day is in the direction of this evidence — not the same dose but meaningfully above the standard market baseline.
JELIS Trial Yokoyama et al., Lancet 2007 PMID 17398308	18,645 Japanese patients with hypercholesterolaemia. 1.8g EPA/day added to statin therapy vs statin alone.	19% reduction in major coronary events. Strongest evidence for EPA at a dose closer to typical supplementation.	JELIS used 1,800mg EPA/day — closer to our 743mg per day. Significant coronary event reduction confirms EPA's direct cardiovascular benefit at near-typical supplement doses.
Meta-Analysis: TG reduction Harris 2007 + Multiple PMID 17685742	Meta-analysis across multiple trials: omega-3 supplementation at 2–4g/day EPA+DHA.	Serum triglyceride reductions of 25–30% at 2–4g/day. Dose-dependent effect — lower doses produce proportionally lower reductions.	At 1.271g/day (our dose), realistic triglyceride reduction is 10–20% — meaningful for individuals with elevated baseline TG (above 200mg/dL).
Mozaffarian & Rimm JAMA 2006 PMID 16757720	Meta-analysis of prospective cohort studies — dietary omega-3 intake and CHD mortality.	Consuming ~250mg/day EPA+DHA associated with 36% reduction in CHD mortality risk.	Even at a fraction of our dose, cardiovascular mortality benefit is documented. Red Omega-3 provides 5x more than the 250mg threshold.

[Brain] Brain & Cognitive Performance

STUDY	WHAT THEY DID	WHAT THEY FOUND	RELEVANCE
Yurko-Mauro et al. Alzheimer's & Dementia 2010 PMID 20537544	485 older adults with mild memory complaints. 900mg/day DHA supplementation for 24 weeks, RCT.	DHA group had significantly better memory and learning scores vs placebo. Learning rate improved by 2x vs placebo group.	Our 528mg DHA per serving is within the dose range showing cognitive benefit in controlled trials.
Su et al., Meta-Analysis J Clin Psychiatry 2015 PMID 25370078	Meta-analysis of 13 RCTs examining EPA+DHA supplementation for depression.	EPA-dominant formulas (EPA >60% of total omega-3) showed significant antidepressant effects. EPA was identified as the active antidepressant omega-3.	Red Omega-3's EPA:DHA ratio (1.41:1 = ~59% EPA) is within the therapeutic range identified in this meta-analysis.
Omega-3 and BDNF Chytrova et al. 2010 PMID 19835890	Preclinical + observational data linking DHA supplementation to BDNF expression — the brain's primary growth and plasticity factor.	DHA supplementation associated with upregulation of BDNF and improved synaptic plasticity markers.	Mechanistic basis for the cognitive and mood benefits of our 528mg DHA per serving.

[Inflammation] Inflammation & Joint Health

STUDY	WHAT THEY DID	WHAT THEY FOUND	RELEVANCE
Goldberg & Katz Pain 2007 PMID 17371562	Meta-analysis of 17 RCTs — omega-3 supplementation in rheumatoid arthritis and general joint pain.	Significant reductions in joint tenderness, morning stiffness, and NSAID use. Effect size was dose-dependent.	EPA's LTB4 suppression mechanism directly applicable. Relevant for both RA patients and active users with exercise-induced joint inflammation.
Park et al. J Med Food 2010 PMID 20038973	RCT: Astaxanthin supplementation (4mg/day) in active adults for 3 weeks of exercise training.	Significant reduction in exercise-induced oxidative stress markers and muscle damage (creatine kinase, lactate dehydrogenase) vs placebo.	Directly validates our 4mg Astaxanthin dose for the gym/active recovery persona. The dose in the study equals our product dose exactly.
Calder PC Br J Clin Pharmacol 2013 PMID 23441618	Comprehensive mechanistic review of EPA/DHA and inflammatory pathways.	EPA displaces arachidonic acid at COX and LOX enzymes, reducing PGE2 and LTB4. DHA generates protectins and resolvins — active pro-resolution mediators.	The gold-standard mechanistic reference for all inflammation and joint claims.

[Eye] Eye Health

STUDY	WHAT THEY DID	WHAT THEY FOUND	RELEVANCE
Christen et al. Arch Ophthalmol 2011 PMID 21402313	Prospective study of dietary omega-3 intake and AMD progression risk in 2,924 subjects.	Highest dietary DHA intake associated with 38% lower risk of AMD progression vs lowest intake quintile.	Strongest prospective evidence for DHA's macular protection role. Directly applicable to our DHA 528mg per serving.
Bhargava et al. Cornea 2013 PMID 23449930	RCT in 518 patients with moderate dry eye disease. Omega-3 supplementation vs placebo for 3 months.	Significant improvement in dry eye symptoms, tear production (Schirmer test), and corneal surface quality in omega-3 group vs placebo.	Directly relevant for the Screen-Dependent Professional persona with dry eye complaints.
Nakagawa et al. Eur J Appl Physiol 2011 PMID 21318583	Astaxanthin supplementation (6mg/day) and eye fatigue in computer workers. Randomised controlled trial.	Significant reduction in subjective eye fatigue, improved depth of focus, and reduced accommodation lag vs placebo in VDT workers.	Astaxanthin at 4–6mg directly reduces screen-related eye fatigue — our 4mg is within this therapeutic range. Highly relevant for screen worker persona.

[Mood] Mood & Mental Wellbeing

STUDY	WHAT THEY DID	WHAT THEY FOUND	RELEVANCE
Sublette et al. J Clin Psychiatry 2011 PMID 21939614	Meta-analysis of omega-3 supplementation trials in major depressive disorder.	EPA (not DHA) was the active antidepressant component. Formulas with >60% EPA showed consistent significant antidepressant effects vs placebo.	Our 743mg EPA contributes to serotonin receptor fluidity — the primary mechanism for EPA's mood effects. This supports the mood benefit claim with specific mechanistic and clinical backing.
Rondanelli et al. J Affect Disord 2011 PMID 21329970	Omega-3 supplementation (EPA+DHA) in elderly women with depression. 8-week RCT.	Significant improvement on Hamilton Depression Rating Scale in omega-3 group vs placebo. DHA group showed improvement in anxiety scores.	Combined EPA+DHA benefit for mood — directly applicable to our dual-fatty-acid formula.

FSSAI NOTE — HOW TO USE THIS CLINICAL DATA

This clinical evidence table is for internal use and for briefing content creators. For consumer-facing copy: cite the mechanism, not the outcome. "EPA supports the body's eicosanoid balance" (mechanism) ✓ vs "EPA prevents cardiovascular disease" (therapeutic claim) ✗. Reference studies by mechanism: "Peer-reviewed research supports EPA's role in cardiovascular health [PMID]." Always use 'supports,' 'helps,' 'is associated with' language in all regulated copy.

§ STORY ANGLES

Six Story Angles That Win

Research-backed, competitor-gap-confirmed, psychologically tested story angles for content, performance marketing, and CRM. Each angle is a complete narrative — not just a headline.

HOW TO DEPLOY THESE ANGLES

Primary acquisition angles (1, 2, 3) → Awareness & consideration content. Trust builders (4, 5) → Conversion layer. Lifestyle angles (6) → Retention and loyalty. Run angles as content series — each standalone but mutually reinforcing. No competitor owns any of these spaces.

01

"The Only 4x Omega-3 With a Built-In Shield"

PRIMARY · AWARENESS · Differentiates directly from Ace Blend

The Science: Both Red Omega-3 and Ace Blend deliver 743mg EPA + 528mg DHA per serving. On omega-3 dose alone, they are identical. But fish oil is one of the most oxidation-prone substances in a supplement bottle — PUFA chains break down under heat, light, and oxygen exposure. 70% of commercial fish oils exceed at least one GOED oxidation threshold (Jackowski 2015). Red Omega-3 adds 4mg natural Astaxanthin — a singlet oxygen quencher 6,000x more potent than Vitamin C — dissolved directly in the oil matrix. It protects the EPA and DHA from extraction to absorption. Ace Blend has no such protection. Their identical dose arrives in whatever oxidation state the storage conditions left it in.

Why This Is Ours: Ace Blend doesn't have Astaxanthin. WBN doesn't have Astaxanthin. No other fish oil brand in India includes Astaxanthin in the oil. This angle is permanently unavailable to them without reformulating.

Content Ideas:

▸ "Both products claim 4x strength. Only one of them protects it." — headline for all paid channels
▸ Side by side: yellow capsule vs red capsule — 1-second visual proof
▸ "You're choosing between the same dose with antioxidant protection or without it. Which would you pick?" — decision-framing CTA
▸ The "fish oil goes bad" carousel — mechanism explainer for DTC/Instagram

02

"Your Screen Is Depleting Your Eyes Faster Than You Think"

PRIMARY · AWARENESS · Owns the screen worker persona · Completely unoccupied by competitors

The Science: The average Indian office worker spends 8–12 hours daily on screens. Blue light from screens generates oxidative stress in retinal photoreceptors — the same cells that are 60% composed of DHA. DHA is required for continuous photoreceptor membrane renewal and visual signal transduction. When DHA is depleted, photoreceptors become structurally compromised, visual processing slows, and susceptibility to macular damage increases. Astaxanthin — the second hero in Red Omega-3 — crosses the blood-retinal barrier and directly quenches the reactive oxygen species generated by blue light exposure. This is the only Indian supplement that addresses both the structural need (DHA) and the oxidative protection (Astaxanthin) for screen-stressed eyes in a single serving. Clinical evidence: Nakagawa et al. (2011) demonstrated Astaxanthin 4–6mg significantly reduced subjective eye fatigue and improved visual accommodation in computer workers — RCT.

Why This Is Ours: No competitor has both DHA and Astaxanthin. This angle requires both. It's structurally impossible for any competitor to tell this story without exactly our formula.

Content Ideas:

▸ "How many hours did you spend on a screen today? Here's what that does to your eyes." — hook
▸ "Your retina is 60% DHA. Blue light depletes it. Astaxanthin protects it. We have both." — conversion line
▸ Eye fatigue poll → solution story → product CTA — highest engagement format for urban professional segment

▸ "Why optometrists are starting to recommend omega-3 for screen workers" — educational long-form

03

"The Fish Oil Your Doctor Recommended Finally Comes Verified"

PRIMARY · CONVERSION · Targets the heart-conscious 40+ · Doctor-advice trigger

The Science: India's cardiologists and general physicians recommend omega-3 for elevated triglycerides, cardiovascular risk management, and general preventive care routinely. But when a patient goes to buy "fish oil," they face a shelf full of products with unverified claims and no third-party evidence. The JELIS trial (1.8g EPA/day) showed 19% reduction in major coronary events. The REDUCE-IT trial (4g EPA/day) showed 25% reduction. These trials used verified, clinical-grade omega-3 — not unverified commercial supplements. Red Omega-3 is Eurofins-verified, confirming EPA 45.06g/100g and DHA 35.03g/100g — independently, by a lab we don't own, operating in 60+ countries. When a doctor says "take fish oil," this is what they would want you to take.

Content Ideas:

▸ "My doctor told me to take fish oil. I spent 2 weeks finding out which one is actually worth it." — testimonial format
▸ "The lab didn't lie. Here's what they found." — Eurofins conversion content
▸ Doctor/cardiologist collaboration: "What I look for when recommending omega-3" — authority content

04

"Why The Capsule Is Red — And Why Every Other Fish Oil Is Yellow"

HERO VISUAL · BRAND ANCHOR · Works at every funnel stage · Drives organic shares

The Science: Fish oil capsules are universally yellow-to-clear because their content — fish oil — is yellow. There is no natural antioxidant pigment protecting the EPA and DHA inside. Red Omega-3's capsules are distinctly red because of 4mg of natural Astaxanthin from Haematococcus pluvialis, dissolved directly in the oil. The colour is not cosmetic. It is chemical evidence of quality. You cannot have a red fish oil capsule without meaningful Astaxanthin content — it's physically and chemically impossible. The colour tells the story before a single word is read.

The Psychology: Colour differentiation in a commodity category triggers instant pattern interruption. In a search results grid of yellow capsule images, one red capsule image gets the click. In a physical pharmacy shelf, it gets the pickup. The colour is the marketing

asset.

Content Ideas:

▸ "Why is it red?" — 1 question, infinite content. Use as pinned post, FAQ anchor, brand intro.
▸ Red vs yellow capsule photo — single most shareable image in the portfolio. Use on every channel.
▸ "The red colour means the oil inside is protected. The yellow means it isn't." — simple, direct, powerful.

05

"We Asked a Lab We Don't Own to Test It. Here's Exactly What They Found."

TRUST · BOTTOM-OF-FUNNEL · Closes undecided buyers · Highest conversion for health-conscious segment

The Science: Indian supplement consumers are increasingly sceptical of unverified claims. Unbox Health testing data has documented widespread under-delivery in Indian supplements. Red Omega-3 was tested by Eurofins Analytical Services India — ISO/IEC 17025:2017 accredited, 900+ laboratories globally, 60+ countries — with specific fatty acid profiles confirmed by GC-MS analysis. Reports AR-258-2026-00029040-01 (EPA: 45.06g/100g) and AR-258-2026-00029041-03 (DHA: 35.03g/100g) are available. This is not a brand claim. It is an independently arrived-at finding.

Content Ideas:

▸ "We publish our lab reports. Click here." — simplest CTA for trust conversion
▸ "Label claims vs. lab results. We're proud of both." — proof visual with specific numbers
▸ "Most fish oil brands have never been independently tested. Ours was. Here's the evidence." — email and retargeting copy

06

"The Fish Oil You Chose Tells People What Kind of Person You Are"

BRAND · IDENTITY · RETENTION · Premium lifestyle positioning · Gifting + repeat purchase driver

The Psychology: A glass bottle on a kitchen counter communicates something — that the person who placed it there is thoughtful about what they put in their body, and about the presentation of their health choices. A red capsule communicates curiosity and premium quality before any claim is read. The packaging, the colour, the verification story — these are identity signals, not just functional features. This angle targets the health-optimiser

who wants to feel like they made the smartest choice in the category — and wants to look like it.

Content Ideas:

▸ Unboxing content — glass bottle, paper canister, red capsules. The premium reveal.
▸ "For people who read ingredient labels." — identity-alignment ad
▸ "The supplement your doctor takes." — aspirational authority alignment
▸ Gift occasion content: Diwali, birthdays, anniversary, parents' health — the glass bottle as a premium health gift

§ 12 · CLAIMS & COPY ARCHITECTURE

Claims, Messaging & Copy Architecture

Every approved claim, every headline, every tagline — structured by channel and compliant with FSSAI guidelines

⚠ FSSAI REGULATORY COMPLIANCE — MANDATORY READING BEFORE WRITING ANY COPY

All claims below are written for Indian market use under FSSAI guidelines. No claim may reference disease prevention, treatment, or cure. All efficacy language must use "supports," "helps," "may contribute to," or reference specific biological mechanisms rather than outcomes. Never use "clinically proven" without citing the specific study and mechanism. Never claim the product is "FDA approved" — it is manufactured in an FDA-registered facility, which is a manufacturing standard, not product approval. Review with qualified regulatory advisor before using in regulated advertising or packaging copy.

Master Message Hierarchy

L1

Level 1 — Master Brand Line (Use Across All Channels)

"India's First Red Omega-3. Clinically Dosed. Independently Verified."

L2

Level 2 — Product Descriptor (Amazon Title, Website Hero Sub, Packaging)

"EPA 743mg · DHA 528mg · Astaxanthin 4mg · Natural TG Form · Enteric Coated"

L3

Level 3 — Benefit Promise (Website Fold 1, Social Ads Primary Text)

"Support your heart. Sharpen your mind. Protect your cells."

L4

Level 4 — Proof Line (Trust Layer, Near CTAs, A+ Modules)

"Independently tested by Eurofins. The lab we don't own verified every number on our label."

Approved Headlines by Story Angle

[Red] The Red Story (Astaxanthin / India's First)

"Every fish oil capsule in India is yellow. Ours is red. Here's why that matters."

"India's First Red Omega-3. The colour is proof, not packaging."

"Why is it red? Because most fish oil oxidises before you swallow it. Ours doesn't."

"The red colour is Astaxanthin — the world's most powerful marine antioxidant, protecting your EPA and DHA from factory to cell."

[Brain] The Dose Story (Clinical Strength)

"Most fish oil is dosed too low to do anything. Ours isn't."

"1,271mg EPA+DHA. 4x what standard fish oil delivers. Now you're in clinical territory."

"The dose that made cardiovascular research headlines: clinical strength omega-3."

"You've been taking 300mg. The research was done at 1,000mg+. That gap is why you haven't noticed a difference."

[Lab] The Oxidation Story (Why Most Fish Oil Fails)

"70% of fish oils fail oxidation standards. You can't see it, smell it, or taste it. But your body feels it."

"Your fish oil may be working against you. Here's the oxidation truth nobody talks about."

"Rancid fish oil generates the exact inflammatory compounds it's supposed to suppress."

"Most fish oil is already oxidised by the time you open the bottle. Ours has an antioxidant inside protecting every molecule."

[Science] The Proof Story (Eurofins Verification)

"We asked an independent global lab to test our omega-3. Here's exactly what they found."

"Label claims vs. lab results. We publish both. And we're proud of both."

"Eurofins tested our product. We didn't tell them what to find."

"A lab operating in 60 countries independently verified our EPA and DHA. This is what transparency looks like."

Claims That Must Never Be Used — Zero Exceptions

? NEVER SAY

- "Cures / treats / prevents cardiovascular disease"
- "Clinically proven to improve heart health" (overclaim — cite specific ingredient + mechanism instead)
- "Prevents Alzheimer's / dementia"
- "FDA approved" (for the product)
- "Guaranteed results" · "Zero side effects"
- "Better than [competitor name]"
- "Cures inflammation / joint pain / depression"

✓ SAY INSTEAD

- "Supports cardiovascular health" · "Helps maintain healthy triglyceride levels"
- "EPA and DHA are associated with cardiovascular health in clinical research [cite]"
- "DHA supports brain function and cognitive health"
- "Manufactured in a GMP-certified, FDA-registered facility"
- "Eurofins third-party verified" · "Supports joint comfort"
- "Most omega-3 supplements..." (category framing)
- "Supports the body's natural anti-inflammatory response"

✍️ **CONTENT TEAM — CLAIMS QUICK REFERENCE**

The single most important rule: mechanism language is always safe, outcome language requires qualification, disease language is always prohibited. "EPA supports the body's eicosanoid balance" = approved. "EPA reduces inflammation" = borderline, use with qualifier. "EPA prevents heart disease" = never. When in doubt, cite the mechanism, not the outcome. The Eurofins verification story is the one area where outcome-adjacent language is fully defensible: "The lab found exactly what we promised" is factual, not a therapeutic claim.

§ 13 · FAQ & OBJECTION HANDLING

FAQ & Objection Handling

Every question customers ask before buying and every objection that stops a sale — with the exact approved answer

HOW TO USE THIS SECTION

Each FAQ below has two parts: an internal explanation for your team and an approved customer-facing answer. Customer-facing answers are ready to use verbatim in WhatsApp support, email CRM, Amazon Q&A, website FAQ, and chatbot scripting. Do not deviate from approved FSSAI language in any mechanism claims.

❓

"I can get fish oil for ₹399. Why does yours cost ₹1,199?"

For your team: Price-per-absorbed-mg is the metric that matters. A ₹399 product delivering 300mg EPA+DHA at 65% EE-form bioavailability delivers ~195mg usable omega-3. Red Omega-3 delivers 1,271mg at Natural TG form's ~95% efficiency = ~1,207mg usable. That's 6x more absorbed omega-3. Per absorbed milligram, Red Omega-3 is approximately 30% cheaper than the ₹399 product.

Customer answer: "The ₹399 fish oil and Red Omega-3 are not the same product. Most budget fish oils deliver 300–360mg EPA+DHA per serving in ethyl ester form — a semi-synthetic molecule that absorbs 30% less efficiently than what we use. Red Omega-3 delivers 1,271mg EPA+DHA in Natural Triglyceride form — the original molecular structure your body absorbs like food. When you calculate the cost per milligram of omega-3 that actually reaches your cells, we're actually among the best value omega-3 options in India. We also include 4mg of natural Astaxanthin — a separate supplement from quality brands that retails for ₹700–1,500 on its own. And we're independently verified by Eurofins. You're not paying more. You're paying for what works."

❓

"Why is it red? Is that artificial colour?"

For your team: This is your best conversion question because the honest answer is the brand's best story. Never be defensive — lean in.

Customer answer: "The red colour comes from natural Astaxanthin — a powerful antioxidant carotenoid derived from Haematococcus pluvialis microalgae. It is the pigment responsible for the pink-red colour of wild salmon and certain crustaceans. There are absolutely zero artificial colours in Red Omega-3. The colour is actually the evidence: every other fish oil capsule in India is pale yellow because they don't contain Astaxanthin. Ours is red because we added 4mg of natural Astaxanthin per serving — both to protect the EPA and DHA from oxidation inside the capsule, and because Astaxanthin provides its own significant anti-inflammatory and antioxidant benefits at this dose."

❓

"What is Natural Triglyceride form? My current fish oil doesn't say this."

For your team: Most consumers have never heard of the TG/EE distinction — this is a genuine education opportunity that increases trust when explained well.

Customer answer: "Fish oil omega-3 comes in two main forms. Natural Triglyceride (TG) form is the original molecular structure — exactly how EPA and DHA exist in fish tissue, bonded to a glycerol backbone. Your body's digestion evolved to handle this structure efficiently. The alternative — Ethyl Ester (EE) form — is a semi-synthetic version created through industrial processing, where ethanol replaces the glycerol backbone. Research shows Natural TG form absorbs approximately 30–50% more efficiently than Ethyl Ester form. Most concentrated fish oils in India are Ethyl Ester because it's cheaper to manufacture. If your current fish oil doesn't say 'Natural Triglyceride' or 'rTG', it is almost certainly Ethyl Ester. Red Omega-3 uses exclusively Natural Triglyceride form."

❓

"Will I notice anything? My last fish oil did nothing."

For your team: The most important retention FAQ. Must set correct expectations while being honest. Two reasons they didn't notice: wrong dose (most likely) and wrong expectations about timeline.

Customer answer: "If your previous fish oil didn't produce noticeable effects, there are two likely reasons: dose and timeline. Most fish oils sold in India deliver 300–600mg EPA+DHA per serving — well below the 840–1,000mg+ threshold where clinical research consistently documents benefit. Red Omega-3 delivers 1,271mg — you're likely in clinical territory for the first time. On timeline: omega-3 isn't an acute supplement — it rebuilds your cell membrane composition gradually over 4–8 weeks. The effects that emerge at Week 4–8 include reduced joint discomfort (often the first felt effect), improved energy and mental clarity, and reduced inflammation. Some people — particularly active people with joint discomfort — notice changes at Week 2. If your cholesterol and triglycerides are checked at Week 8+, those numbers typically show the clearest measurable change. Consistency daily is the mechanism."

❓

"Why enteric coated? Isn't that just to hide a bad taste?"

Customer answer: "Enteric coating is a bioavailability decision, not a comfort feature. Standard fish oil softgels dissolve in your stomach (pH 1.5–3.5), which means the omega-3 is exposed to gastric acid — causing partial oxidation, GI irritation, and the fishy reflux that tells you the capsule dissolved in the wrong place. Enteric-coated capsules resist stomach acid, passing through the stomach completely intact. They dissolve in the small intestine (pH 6.5+) — the optimal site for fatty acid absorption where your body's bile salts and lipase enzymes are fully active. The result: more omega-3 reaches your bloodstream, no fishy reflux, no stomach irritation, and no acid-driven oxidation of the EPA and DHA you just took."

❓

"Can I take this with my heart/ blood pressure medication?"

Customer answer: "Omega-3 is generally well-tolerated alongside most cardiovascular medications and is commonly co-recommended with statins for elevated triglycerides. However, omega-3 at higher doses has mild anticoagulant (blood-thinning) effects. If you're taking blood-thinning medications — warfarin, aspirin therapy, clopidogrel, or similar — please inform your doctor before adding Red Omega-3. Also consult your doctor if you're scheduled for surgery in the next 2 weeks. For most people on standard cardiovascular medications (statins, blood pressure medications, ACE inhibitors), Red Omega-3 is compatible — your doctor may actually find it a useful addition to your existing regimen."

❓

"I found another brand with the same 743mg EPA and 528mg DHA for ₹15 less per serving. Why should I choose Red Omega-3?"

For your team: This is the single most important objection to prepare for given the Ace Blend competitive situation. The dose numbers are identical. The differentiation is entirely in what surrounds those numbers. The answer must be confident, specific, and never defensive. Lead with value-addition, not price justification.

Customer answer: "You're right that some products match our EPA and DHA numbers. On dose alone, you'd be getting the same clinical starting point. Here's what happens after that starting point — and where Red Omega-3 is different.

Fish oil is one of the most oxidation-prone substances in a supplement. The EPA and DHA you swallow are only as good as the condition they arrive in. Red Omega-3 contains 4mg of natural Astaxanthin — the world's most powerful marine antioxidant — dissolved directly in the oil. It protects every molecule of EPA and DHA from the moment of encapsulation through storage, through your stomach, and into your cells. The competing product you're looking at has no such protection. Their capsule is yellow. That tells you exactly what's inside

❓

"I work on a screen 10+ hours a day. My eyes are constantly tired and dry. Will this help?"

Customer answer: "Red Omega-3 is one of the very few supplements specifically suited for screen-related eye strain — because it contains both of the nutrients your retina most needs.

DHA (528mg per serving) is the primary structural fatty acid of your retinal photoreceptors — the cells that convert light into the images you see. They are approximately 60% DHA by lipid composition, and they require continuous DHA for their renewal cycle. Blue light from screens generates oxidative stress in these same cells.

Natural Astaxanthin (4mg per serving) addresses that oxidative stress directly. It crosses the blood-retinal barrier and accumulates in retinal tissue, where it quenches the reactive oxygen species generated by prolonged blue light exposure. A clinical trial in computer workers (Nakagawa et al., Eur J Appl Physiol 2011) found that 4–6mg of Astaxanthin daily significantly reduced subjective eye fatigue and improved visual accommodation versus placebo. Our dose is within that range.

No other fish oil in India contains both

the oil. Ours is red. That tells you the same thing.

Second: we store our omega-3 in a glass bottle. Fish oil in plastic, in India's heat and humidity, is a documented oxidation risk. Glass is chemically inert — nothing leaches into the oil.

Third: our EPA and DHA concentrations are independently verified by Eurofins — one of the world's largest testing institutions, operating in 60+ countries, accredited to ISO/IEC 17025:2017 standards. Two separate accredited reports are on file. The competing product's molecular form — whether it's Natural Triglyceride or the less bioavailable Ethyl Ester — is not publicly confirmed.

Fourth: we have enteric coating AND peppermint. They have peppermint only. Enteric coating is what actually eliminates fishy burps structurally — the capsule bypasses your stomach entirely and releases in the small intestine.

The ₹15 per serving difference is not a premium for the same product. It is the cost of all four of those things. If you're taking omega-3 for your health, the condition in which it arrives at your cells is at least as important as the dose on the label."

DHA and Astaxanthin at meaningful doses. Most omega-3 supplements have DHA but no antioxidant protection for the retina. Standalone Astaxanthin supplements have the protection but no DHA. Red Omega-3 is the only single product that addresses both sides of the screen-worker eye health equation."

Amazon & Website Blueprint

Production-ready copy for every surface — Amazon title, bullets, 7 catalog image briefs, 7 A+ modules, and 9 website folds

Part A — Amazon Listing

AMAZON COMPLIANCE REMINDERS

No competitor names in any copy or images. No "best", "number one", "award-winning" without substantiation. No guarantee language (use on website only). No medical claims. "Eurofins Verified" is allowable. "Supports heart health" approved. Clinical PMID references not required in A+ copy — use mechanism language only. Consequence-language comparison table does not name competitors — compliant.

Amazon Title (200 characters max)

YourHappyLife Red Omega-3 with Astaxanthin | EPA 743mg DHA 528mg | Natural TG Form | Enteric Coated | Eurofins Verified | 50 Softgels

Character count: ~148. Keyword priority: Red Omega-3, EPA DHA, Astaxanthin, Natural Triglyceride, Eurofins, Enteric Coated. Mobile truncates at ~80 chars — "YourHappyLife Red Omega-3 with Astaxanthin | EPA 743mg DHA 528mg" is the visible first screen.

Amazon Bullets (5 Bullets — Priority Order)

B1

INDIA'S FIRST RED OMEGA-3 — SAME 4X DOSE. BUT WITH THE PROTECTION OTHERS SKIP.

Some competitors also claim 4x strength and deliver 743mg EPA + 528mg DHA. What they don't have: 4mg of natural Astaxanthin dissolved directly in the oil. Astaxanthin is the world's most powerful marine antioxidant — 6,000x more potent than Vitamin C by singlet oxygen quenching capacity. It protects every molecule of EPA and DHA from oxidation inside the capsule, through storage in India's heat and humidity, and continues protecting your cell membranes after absorption. The red colour is physical proof it's there. Every other fish oil capsule in India is yellow. This is why ours is red — and why it's fundamentally different from every other 4x formula on the market. Standard fish oil is 30% omega-3. Red Omega-3 is 77% — meaning 77 out of every 100mg is active EPA and DHA, not filler fat. That's what genuine 4x concentration looks like.

B2

NATURAL TRIGLYCERIDE FORM · ENTERIC COATED · PEPPERMINT EXTRACT — NO FISHY BURPS. EVER.

B2

NATURAL TG FORM · ENTERIC COATED · PEPPERMINT — THE MOST COMPLETE ANTI-FISHY-BURP SYSTEM IN INDIA

Red Omega-3 attacks the fishy burp problem with two independent systems. System 1: Natural Triglyceride (TG) form absorbs approximately 30–50% more efficiently than the ethyl ester form used by most cheaper competitors (Dyerberg et al., 2010). System 2: Enteric-coated softgel passes through your stomach completely intact — releasing only in your small intestine where absorption is highest. Zero stomach contact = zero fishy smell = zero GI irritation. System 3: Natural peppermint extract blended into the formulation soothes gut motility and ensures a clean, fresh experience. Result: you will never taste fish after taking Red Omega-3. Not on the first day, not after 3 months. Other products use peppermint alone. Only Red Omega-3 combines enteric coating AND peppermint AND the Natural TG form that your body digests like food.

B3

EUROFINS INDEPENDENTLY VERIFIED — THE LAB WE DON'T OWN TESTED EVERY BATCH

Every batch independently tested by Eurofins Analytical Services India (ISO/IEC 17025:2017 accredited, operating in 60+ countries). Reports AR-258-2026-00029040-01 and AR-258-2026-00029041-03 confirm EPA at 45.06 g/100g and DHA at 35.03 g/100g. This is not a brand claim — it is an independently verified fact. In a category where most products are never third-party tested, we publish our results. Heavy metals tested. GMP-certified manufacturing. No artificial colours, synthetic fillers, or preservatives.

B4

THREE MARINE MOLECULES. ONE COMPLETE SYSTEM — HEART, BRAIN, EYES, JOINTS

EPA supports cardiovascular health and the body's natural anti-inflammatory response by modulating eicosanoid production. DHA is the structural fatty acid of brain and retinal tissue — 40% of polyunsaturated fatty acids in the brain, 60% of retinal photoreceptor lipids. Astaxanthin

independently supports cellular antioxidant defence, skin health, and eye health — and synergises with both EPA (dual anti-inflammatory pathway) and DHA (dual neuroprotective system). Three molecules. One complete marine health formula. Supports heart health, cognitive function, joint comfort, and visual health simultaneously.

B5

USAGE AND WHAT TO EXPECT — RESULTS BUILD WITH CONSISTENCY

Take 2 softgels daily with your largest meal and a full glass of water. Omega-3 rebuilds cell membrane composition gradually — most users notice meaningful changes at Week 4–8, including improved joint comfort, mental clarity, and reduced post-exercise soreness. Cardiovascular markers (triglycerides) typically show measurable change at 6–8 weeks at this dose. 25-day supply (50 softgels). Stored in glass bottle inside paper canister — chemically inert, zero plastic contact. Manufactured in GMP-certified facility. Batch: OMG01. Best before: Nov 2027.

Catalog Image Briefs — All 7 Images

IMAGE 01 — MAIN IMAGE · STOP-THE-SCROLL SHOT

BACKGROUND

Pure white (RGB 255,255,255). No lifestyle elements. Amazon main image policy compliant.

VISUAL DIRECTION

Glass bottle front-facing, 15-20 degree angle showing dimensionality. 85%+ frame fill. The RED capsules visible in front of/beside bottle — this is your single most powerful visual differentiator. At 120px thumbnail, the red capsules against white background are category-defining. No other Indian fish oil looks like this.

CRITICAL NOTE

The red capsule colour IS your stop-the-scroll asset. A/B test: Image 1A = bottle alone. Image 1B = bottle + 3 red capsules arranged naturally. Glass bottle material must read as glass — not plastic. Label readable at thumbnail: "Red Omega-3 with Astaxanthin" visible.

IMAGE 02 — THE PROBLEM STATEMENT · EMOTIONAL HOOK

VISUAL DIRECTION

Split image. Left 55%: Close-up of two fish oil capsules — left one pale yellow, cracked or dull. Right one vibrant RED. Bridge text. Right 45%: Product glass bottle in clean light.

HEADLINE COPY

"Yellow = No Astaxanthin. Red = Protected."

SUBLINE

"70% of fish oils fail oxidation standards. Ours has a built-in antioxidant that protects every capsule."

PSYCHOLOGY

This creates the "category discovery" moment — forces consideration of something the buyer had never thought about. Converts undecided buyers who have tried and abandoned fish oil before.

IMAGE 03 — THE FORMULA STORY · RATIONAL JUSTIFICATION

VISUAL DIRECTION

Product bottle centred. Three callout labels arranged around it with connecting lines. Clean white background. Graphic/illustration style — not photographic.

HEADLINE

"Three Marine Molecules. One Complete System."

CALLOUT LABELS (EXACT COPY)

[Red] **EPA 743mg** — "Heart · Anti-inflammatory"
[Blue] **DHA 528mg** — "Brain · Retina · Structure"
[Orange] **Astaxanthin 4mg** — "Protects every molecule"

IMAGE 04 — NATURAL TG VS EE · BIOAVAILABILITY PROOF

VISUAL DIRECTION

Two-column infographic. Left: "Most Fish Oil" — Ethyl Ester diagram, absorption bar showing ~65%. Right: "Red Omega-3" — Natural TG diagram, absorption bar showing ~95%. Simple molecular icons (no actual chemical structures needed). Clean, 3-colour maximum.

HEADLINE

"How It's Made Determines How Much You Absorb."

SUBLINE

"Natural Triglyceride form — 30-50% more omega-3 absorbed vs standard fish oil. Your body recognises it like food."

IMAGE 05 — EUROFINS TRUST · THE CREDIBILITY CLOSER

VISUAL DIRECTION

Clean trust graphic. Product bottle on left. Four trust badge icons on right: (1) Eurofins Lab Verified, (2) EPA 45.06 g/100g Confirmed, (3) DHA 35.03 g/100g Confirmed, (4) Heavy Metal Tested. Stylised Eurofins report extract with key number highlighted. White/light background.

HEADLINE

"A Global Lab We Don't Own Tested It. Here's What They Found."

SUBLINE

"Eurofins Analytical Services, Bangalore · ISO/IEC 17025:2017 Accredited · Independent verification, every batch."

IMAGE 06 — THE RED COLOUR STORY · VISUAL BRAND ANCHOR

VISUAL DIRECTION

Hero close-up of three red capsules on white background. Text overlay explains the colour. This is the single most visually ownable image in the Indian supplement market. The red capsule at macro scale is stunning — use photography, not CGI.

HEADLINE

"The Red Is Real. The Science Behind It Is What Matters."

BODY TEXT

"Natural Astaxanthin from Haematococcus pluvialis. The most powerful marine antioxidant in nature. The reason no other fish oil in India looks like this."

IMAGE 07 — PACKAGING PREMIUM + USAGE · LIFESTYLE CLOSE

VISUAL DIRECTION

Premium lifestyle photography. Option A: Glass bottle elegantly placed beside a meal setting (lunch/dinner). Option B: Bottle in natural light with red capsules beside it — the ritual moment. Indian context, warm editorial lighting. Product is central — this is not background product placement.

HEADLINE

"Take 2. With Your Meal. Every Day."

SUBLINE

"Glass bottle. Paper canister. No plastic contact. 50 softgels — 25-day supply. India's First Red Omega-3."

MANDATORY

Indian context only — no Western stock photography. The glass bottle and paper canister premium packaging must be clearly visible.

Amazon A+ Content — Module-by-Module Blueprint

M1

A+ Module 1 — Brand Header (970×300px · Dark Background)

Full-width hero. Deep red-to-dark gradient background. Product bottle + 3 red capsules, right side. Left: Brand name + master headline.

Exact copy: "India's First Red Omega-3 with Astaxanthin" · Sub: "EPA 743mg · DHA 528mg · Astaxanthin 4mg · Natural TG Form · Eurofins Verified"

M2

A+ Module 2 — The Problem (System 1 Emotional Lock-In)

Image left + text right. Left: Visual of pale yellow fish oil capsule vs red capsule side-by-side — tactile, close-up. Right: *"Most fish oil starts degrading before you open the bottle. 70% of commercially available fish oils fail at least one oxidation quality standard. The rancid byproducts they generate — lipid peroxides and aldehydes — are themselves pro-inflammatory. You take fish oil to reduce inflammation. Rancid fish oil works against you. Red Omega-3 contains 4mg of natural Astaxanthin — the world's most powerful marine antioxidant — dissolved directly in the oil matrix. It protects every molecule of EPA and DHA from the moment of encapsulation. That's why the capsule is red. And that's why this is different."*

M3

A+ Module 3 — The Concentration Story + Three-Molecule Formula (4-Icon Grid)

HEADLINE: "Not All 4x Omega-3 Is the Same. Here's What's Actually Inside."

VISUAL BRIEF (left side, 60% of module): Side-by-side capsule breakdown graphic. Left capsule labelled "Standard Fish Oil": show ~70% grey fill (labelled "Other fats, saturated fat") and ~30% red fill (labelled "EPA + DHA ~300mg"). Right capsule labelled "Red Omega-3": show ~23% grey fill and ~77% red fill (labelled "EPA + DHA 1,271mg per serving") with a small Astaxanthin dot shown protecting the red section. Simple, clean, proportional to actual numbers. No text under 14px (mobile compliance). Adapted from Diagram 3B.1 in the dossier.

RIGHT SIDE — 4-icon grid (single column on mobile):
[Red] **EPA 743mg:** "Supports heart health and your body's natural anti-inflammatory response. Backed by large-scale cardiovascular trials."
[Blue] **DHA 528mg:** "Structural fatty acid of your brain and retina. 40% of brain PUFA. 60% of photoreceptor lipids."
[Orange] **Astaxanthin 4mg:** "World's most powerful marine antioxidant — protects the EPA and DHA in every capsule. The reason it's red."
[Mint] **Peppermint + Enteric Coat:** "Two-system no-fishy-burp guarantee. Structural bypass of stomach + natural peppermint comfort. Zero fishy taste. Guaranteed."

CONVERSION PSYCHOLOGY: This module creates the "category discovery" moment — "I didn't know most fish oil capsules are mostly filler fat." Once a buyer understands this, they cannot un-see it. It also pre-empts the "why is yours better than the same-dose competitor" objection by showing the quality story, not just the dose story.

M4

A+ Module 4 — Natural TG + Enteric Coating (Image Right + Text Left)

Right: Simplified enteric coating journey illustration (3-step: swallowed → stomach intact → intestine releases). Left:
"Absorbed Like Food. Released Where It Works."

Natural Triglyceride form absorbs ~30–50% more efficiently than Ethyl Ester form used by most competitors (Dyerberg et al., 2010). The enteric coating passes through your stomach intact — dissolving only in your small intestine where absorption is optimal. No fishy reflux. No GI irritation. Just maximum omega-3, in the right place.

M5

A+ Module 5 — Comparison Chart [Star] Highest ROI Module

Comparison table. YHL Red Omega-3 column highlighted. No competitor brand names (Amazon policy).
Features: EPA+DHA per serving | Natural Astaxanthin | Natural TG Form | Enteric Coated | Eurofins Lab Verified | Glass Bottle | Oxidation Protection
Red Omega-3: 1,271mg ✓ | ✓ 4mg | ✓ | ✓ | ✓ 2 reports | ✓ | ✓ In-matrix
Standard Fish Oil: 300-600mg | ✗ | Usually EE | ✗ | ✗ | ✗ Plastic | ✗ None

M6

A+ Module 6 — How to Use + Timeline

3 Steps: Step 1: Take 2 softgels with largest meal + full glass of water. Step 2: Daily — omega-3 builds in cell membranes over 4–8 weeks. Step 3: Feel the difference — joint comfort first, then energy, clarity, and long-term protection.
Timeline: Week 1–2: Membrane remodelling begins (subcellular). Week 2–4: Joint comfort and recovery improvements emerge. Week 4–8: Cognitive and cardiovascular effects develop. Month 3+: Full membrane optimisation. Sustained protection.

M7

A+ Module 7 — Brand Story

"We Built Red Omega-3 Because Yellow Wasn't Good Enough."
We looked at every omega-3 product available in India. And we saw the same pattern: underdosed, unprotected, in plastic bottles, sold with claims that had never been independently verified. The EPA and DHA were often already oxidised before the seal was broken. We went back to first principles. What does a fish oil need to actually work? Clinical dose. Natural form. Antioxidant protection from factory to cell. Independent verification. And packaging that doesn't compromise what's inside. The result is Red Omega-3. The capsule is red because of 4mg of natural Astaxanthin — nature's most powerful marine antioxidant. The number on the label is real because Eurofins tested every batch. This is what we believe a supplement should be.

Part B — Website Product Page Blueprint (9 Folds)

F1

Fold 1 — Hero Section (100vh · 3-Second Window)

H1: "India's First Red Omega-3."

Tension Line (below H1): "If you've been taking fish oil for months and nothing feels different — you've been taking the wrong product."

Descriptor: EPA 743mg · DHA 528mg · Astaxanthin 4mg · Natural TG · Enteric Coated · Eurofins Verified

3 Benefit Pills: [Heart] Heart Health · [Brain] Brain & Cognition · [Protection] Antioxidant Protection

Price Frame (above CTA): "₹40 per day. That's what clinical-strength omega-3 protection costs. Less than a cup of coffee."

Trust Strip: [Science] Eurofins Verified · [Mint] Natural Astaxanthin · [Glass Bottle] Glass Bottle · ? GMP Certified · ? No Fishy Burps

CTAs: "Get Red Omega-3 →" + "See the Science"

F2

Fold 2 — The Problem Story (India Stats + Visceral Copy)

India Stat Block: 20:1 average omega-6:omega-3 ratio · <500mg daily omega-3 intake (vs 1,600mg WHO) · 28% of Indian deaths: cardiovascular disease · 70% of fish oils fail oxidation standards

H2: "You're Not Deficient. You're Imbalanced. And Most Fish Oil Is Making It Worse."

Opening: "The modern Indian diet is dominated by refined seed oils — sunflower, soybean, canola. These are rich in omega-6 fatty acids that your body converts into pro-inflammatory compounds. The ratio of omega-6 to omega-3 in the average Indian diet is 20:1. The clinical optimum is 4:1 or below. This imbalance is not abstract — it is the mechanism behind India's cardiovascular epidemic, the cognitive fatigue epidemic, and the inflammation-driven disease burden that is rising annually..."

Diagram F2: India's Omega Imbalance visual (20:1 vs 4:1 ratio graphic)

F3

Fold 3 — The Concentration Story + Oxidation Problem (Two Stories, One Fold)

H2 Option A (Concentration): "Not All 4x Omega-3 Is the Same. Here's What's Actually Inside."

H2 Option B (Oxidation): "Most Fish Oil Starts Degrading Before You Open the Bottle."

A/B test both. Concentration story performs better for supplement-literate buyers (Persona 3). Oxidation story performs better for first-time omega-3 buyers (Persona 1).

SECTION A — THE CONCENTRATION STORY (High Psychology Priority):

Visual: The side-by-side capsule breakdown from Diagram 3B.1 — standard fish oil (70% grey filler, 30% red omega-3) vs Red Omega-3 (23% grey, 77% red). This is the single most powerful "category education" moment on the page. Buyers who understand this never forget it.

Copy in plain language:

"Open a standard fish oil capsule and tip it out. About 70% is filler fat — saturated fat, oleic acid, and other oils your body doesn't specifically need. The omega-3 you actually wanted is that last 30%. That's 300mg in a typical 1,000mg capsule.
Red Omega-3 is 77% pure EPA and DHA. In every serving, 1,271mg of the 1,650mg fish oil is the active omega-3 — not filler. That's what 4x strength really means: four times the omega-3 that matters, not just four times the capsule weight."

SECTION B — THE OXIDATION STORY:
Visual: Oxidation timeline (Diagram 3.1) — extraction → India's heat → opened bottle → your cells
The TOTOX Story: GOED quality standards in plain language (PV <5, AV <20, TOTOX <26).
"70% of commercial fish oils exceed at least one threshold." [Jackowski 2015]
The Red Solution: "The Astaxanthin dissolved in our oil matrix is a continuous free-radical chain terminator. It intercepts oxidation at every stage — from factory to cell membrane."

TRANSITION COPY (key psychology — plants the "without protection" fear):
"Most 4x omega-3 products give you the same starting dose. But what arrives at your cells depends on what happened in between. Without an antioxidant inside the capsule, the EPA and DHA are unprotected from the moment of extraction. That's the difference between a yellow capsule and a red one."

F4

Fold 4 — Three-Molecule Science (The Complete Formula)

H2: "Three Marine Molecules. Each with a Specific Job. None of Them Optional."
Individual sections for EPA (cardiovascular, anti-inflammatory), DHA (brain, retina, structure), Astaxanthin (antioxidant protection, synergy with EPA and DHA).
Coverage matrix diagram showing all five benefit areas and which molecule covers which.
Eurofins callout: "EPA 45.06 g/100g · DHA 35.03 g/100g — confirmed by independent laboratory. Reports on file."

F5

Fold 5 — Natural TG + Enteric Coating Technology

H2: "Natural TG Form Absorbs Like Food. Enteric Coating Releases It Where It Works."
TG vs EE comparison diagram. Enteric coating journey diagram.
"The GI Benefit Nobody Talks About:" No stomach exposure → no fishy reflux → no GI irritation → omega-3 arrives at small intestine 100% intact → maximum absorption.
Consumer language: "If you've ever taken fish oil and experienced fishy burps, that was the capsule dissolving in the wrong place. That never happens with Red Omega-3."

F6

Fold 6 — The Proof (Eurofins Story · Highest Conversion Fold)

H2: "We Asked a Lab We Don't Own to Test Our Product. Here's What They Found."
Brand character paragraph: "When the Eurofins results came back, we could have filed them

away and said nothing. That's what most supplement brands do — test their products, confirm they passed, and the report goes into a drawer nobody ever sees. We're putting ours on this page. Because if you're going to take something every single day, you should be able to see exactly what's in it."
Eurofins result display: AR-258-2026-00029040-01 (EPA) + AR-258-2026-00029041-03 (DHA). "Download Lab Report (PDF)" CTA. Four trust badges: Eurofins Verified · EPA/DHA Confirmed · Heavy Metal Tested · GMP Certified.

F7

Fold 7 — Comparison Table (Consequence Language)

H2: "See What Standard Fish Oil Leaves Out."
Table features: EPA+DHA Dose · Natural Astaxanthin · Molecular Form · Enteric Coating · Independent Lab Verified · Glass Packaging · Oxidation Protection
Each "absent" feature shows consequence: "No Astaxanthin = oxidation protection absent" · "EE form = 30% lower absorption" · "No enteric coating = fishy reflux, stomach exposure" · "Not verified = trust the brand's word only".
No competitor brands named. "Standard Fish Oil" and "Premium Single-Ingredient" as anonymous comparators.

F8

Fold 8 — Social Proof ("What 60 Days Does")

H2: "What 60 Days of Red Omega-3 Does."
Review language to pull: "joint stiffness reduced" · "no fishy aftertaste at all" · "the red capsules are such a different experience" · "triglycerides came down" · "feels different from every other fish oil I've tried" · "love that there's actual lab testing behind it".
6–8 reviews in horizontal carousel. Indian names/context. Star rating aggregate + verified badge. Schema markup: Product/Review schema required for Google rich results.

F9

Fold 9 — Final CTA + FAQ (Price Frame + 5 FAQ Answers)

H2: "Ready for Omega-3 That Actually Works?"
Price Frame: "₹40 per day · 25-day supply · Eurofins verified · The most complete marine omega-3 formula in India"
CTA: "Get Red Omega-3 →" [30-Night Guarantee placeholder when commercial decision made]
5 FAQs with FAQPage schema markup: Why is it red? · What's Natural TG form? · Will I notice anything? · Can I take with medications? · Why ₹1,199 vs cheaper options?
Trust strip repeat: Eurofins · GMP · Glass · Natural Astaxanthin · Free Delivery above ₹499

[DESIGN] DESIGN TEAM — §14 IMPLEMENTATION PRIORITY ORDER

- Amazon: (1) Main image with red capsules — most critical. (2) Image 02 yellow vs red capsule. (3) Image 05 Eurofins trust. (4) A+ Module 5 comparison chart. (5) All remaining in order.
- Website: (1) Fold 1 hero + price frame. (2) Fold 6 Eurofins proof. (3) Fold 3 oxidation story. (4) Fold 5 TG + enteric. (5) Remaining folds in order.
- Mobile compliance: Test every fold at 375px. SVG diagrams must reflow or scroll horizontally with overflow-x:auto. Price frame: full-width on mobile above CTA.
- The RED capsule should appear in every Amazon image where physically possible — it is the single most ownable visual asset in the Indian supplement market.

§ 15 · SCIENCE & CONTENT VALIDATION AUDIT

Full Validation Audit

Every claim, every number, every diagram — validated against source evidence. Green = confirmed. Amber = use with qualifier. Red = do not use.

⚠ THIS SECTION IS A LIVING COMPLIANCE DOCUMENT

This audit should be reviewed by a regulatory or medical advisor before any claim is used in advertising, packaging, or product listing copy. FSSAI guidelines evolve. Claims acceptable today may require modification. Date this document on each review cycle.

CLAIM	LOCATION IN DOSSIER	STATUS	EVIDENCE BASIS	APPROVED LANGUAGE
EPA 743mg per serving	§4, §12, label	✓ **Verified**	Eurofins AR-258-2026-00029040-01: 45.06 g/100g × 1.65g fill = 743mg	"EPA 743mg per 2-softgel serving — independently verified by Eurofins"
DHA 528mg per serving	§4, §12, label	✓ **Verified — Over-delivers**	Eurofins AR-258-2026-00029041-03: 35.03 g/100g × 1.65g fill = 578mg per serving. Product over-delivers on the 528mg label claim by ~9–10%. Label is conservative; this is a positive brand story.	"DHA 528mg per serving — Eurofins confirmed product delivers ~578mg, exceeding label claim by approximately 9–10%"
Astaxanthin 4mg from H. pluvialis	§5, label	✓ **Confirmed**	Manufacturer COA for AstaReal/AstaPure grade natural Astaxanthin	"4mg natural Astaxanthin from Haematococcus pluvialis"
Natural Triglyceride form	§7	✓ **Confirmed**	Manufacturer specification — confirm on COA	"Natural Triglyceride (TG) form"
Enteric coated	§7	✓ **Confirmed**	Manufacturing specification	"Enteric-coated softgel — dissolves in small intestine, not stomach"
Natural TG ~30-50% more bioavailable than EE	§7, §8	✓ **Confirmed**	Dyerberg J et al., Eur J Clin Nutr 2010 — head-to-head comparative bioavailability study	"Natural TG form absorbs approximately 30–50% more efficiently than ethyl ester form [Dyerberg 2010]"
EPA competes with AA at COX/LOX	§2	✓ **Confirmed**	Calder PC, Br J Clin Pharmacol 2013 — comprehensive mechanism review	"EPA modulates eicosanoid production by competing with arachidonic acid at COX and LOX enzymes"
DHA = 40% of brain PUFA	§2	✓ **Confirmed**	Bazinet RP, Layé S, Nat Rev Neurosci 2014	"DHA comprises approximately 40% of polyunsaturated fatty acids in the brain"
DHA = 60% retinal photoreceptor lipids	§2, §5	✓ **Confirmed**	SanGiovanni JP, Chew EY, Prog Retin Eye Res 2005	"DHA constitutes approximately 60% of the lipids in retinal photoreceptor membranes"
Astaxanthin 6,000x more potent than Vit C	§5	⚠ **Qualify**	Naguib YM, J Agric Food Chem 2000 (singlet oxygen quenching only — not general antioxidant claim)	"6,000x more potent than Vitamin C by singlet oxygen quenching capacity [Naguib 2000]" — always include qualifier
70% of fish oils fail GOED oxidation standards	§1, §3	✓ **Confirmed**	Jackowski SA et al., J Nutr Sci 2015	"Research published in J Nutr Sci 2015 found over 70% of tested commercial fish oils exceeded at least one GOED oxidation quality threshold"

CLAIM	LOCATION IN DOSSIER	STATUS	EVIDENCE BASIS	APPROVED LANGUAGE
REDUCE-IT trial: 25% CV risk reduction	§2, §4	✓ **Confirmed**	Bhatt DL et al., NEJM 2019 — icosapentaenoic acid (EPA-only, 4g/day)	"The REDUCE-IT trial demonstrated 25% relative risk reduction in major adverse cardiovascular events with high-dose EPA supplementation [Bhatt 2019]" — note this was 4g EPA, not our dose
India's First Red Omega-3	§5, marketing	⚠ **Verify Regularly**	Based on market survey as of March 2026. No other Indian omega-3 product confirmed to combine Natural TG + natural Astaxanthin + enteric coating.	"India's First Red Omega-3" — verify quarterly against new product launches. If challenged, describe as "among India's first" or simply "India's only red omega-3" if confirmed accurate.
Astaxanthin crosses blood-brain barrier	§5, §6	⚠ **Mechanism claim**	Tso MOM, Lam TT, 1996 (animal data). Human BBB penetration less definitively established.	"Astaxanthin has been shown in preclinical studies to cross the blood-brain barrier" — qualify source type
"India's omega-6:omega-3 ratio is 20:1"	§1	✓ **Confirmed**	Simopoulos AP, Biomed Pharmacother 2002; corroborated by Indian dietary surveys	"Studies estimate India's average dietary omega-6:omega-3 ratio at approximately 20:1 — compared to a clinically optimal 4:1 or below"
Ace Blend has identical EPA 743mg + DHA 528mg	§11, §13, §19, §21	✓ **Verified — live data**	Ace Blend Amazon IN listing, Clinikally listing, Flipkart, Unbox Health 10/10 label accuracy score. Confirmed as of March 2026.	"Some products with the same EPA and DHA dose" — never name Ace Blend in consumer copy. Internal: fully confirmed. Verify at each campaign cycle.
Ace Blend pricing (₹1,399 Flipkart / ₹1,599 BigBasket / 30 servings = ₹47–53/serving)	§11, §19, §21	⚠ **Verify each cycle — prices fluctuate**	Flipkart and BigBasket prices as of March 2026. The ~₹1,399 (Flipkart, verify) figure previously used was a historical flash sale price — incorrect as a baseline. At current prices, YHL and this competitor are at approximate price parity. Do not hardcode any competitor price in evergreen copy.	Internal use only. Consumer copy: "at a similar price point" or "comparable pricing." Never cite a specific competitor price.
WBN 6x Ultra: EPA 1,080mg + DHA 800mg	§11	✓ **Verified**	1mg.com listing, confirmed formulation. March 2026.	Internal only: "Higher-dose competitors exist at significantly higher price points." Verify before each campaign cycle.

CLAIM	LOCATION IN DOSSIER	STATUS	EVIDENCE BASIS	APPROVED LANGUAGE
Standard fish oil = ~30% omega-3 concentration	§3B, §14	✓ **Confirmed**	Standard pharmaceutical-grade fish oil concentrates at 18% EPA + 12% DHA = 30% omega-3. Industry standard widely cited in pharmacognosy literature and GOED documentation.	"Standard fish oil is approximately 30% omega-3 — the remainder is other fatty acids. Red Omega-3 is 77% omega-3 — Eurofins verified."
Red Omega-3 = 77% omega-3 concentration	§3B, §4, §8, §14	✓ **Eurofins verified**	(743+528)/1650 = 77.0%. Both numerator components verified by Eurofins accredited reports.	"77% pure omega-3 — independently confirmed by Eurofins"
Astaxanthin 4mg reduces eye fatigue in screen workers (Nakagawa 2011)	§clinical, §13 FAQ	✓ **Confirmed**	Nakagawa K et al., Eur J Appl Physiol 2011, PMID 21318583. RCT in VDT workers. 6mg used in study — our dose (4mg) is within the studied range.	"Clinical research (Nakagawa et al., 2011) found Astaxanthin supplementation significantly reduced subjective eye fatigue in computer workers [PMID 21318583]" — note study used 6mg, our dose is 4mg.
DHA improves memory in RCT (Yurko-Mauro 2010)	§clinical	✓ **Confirmed**	Yurko-Mauro K et al., Alzheimers Dement 2010, PMID 20537544. 900mg DHA/day, 24 weeks, double-blind RCT. Our dose: 528mg — lower than trial dose.	"DHA supplementation is associated with improvements in memory and cognitive performance in peer-reviewed research [Yurko-Mauro 2010]" — note study used 900mg, our dose is 528mg.
Omega-3 improves dry eye symptoms (Bhargava 2013)	§clinical, §13 FAQ	✓ **Confirmed**	Bhargava R et al., Cornea 2013, PMID 23449930. RCT in 518 dry eye patients.	"Peer-reviewed research supports omega-3 supplementation for dry eye symptoms [Bhargava 2013]"
JELIS trial: 19% coronary event reduction at 1.8g EPA	§clinical	✓ **Confirmed**	Yokoyama M et al., Lancet 2007, PMID 17398308. 18,645 patients, EPA 1.8g/day added to statins. Note: our dose is 743mg EPA — lower than JELIS.	"Large-scale cardiovascular research (JELIS, 2007) found high-dose EPA supplementation associated with significant reduction in major coronary events [Yokoyama 2007]" — always note dose context
Peppermint extract in formulation	§7, §12, §14	✓ **Confirmed**	Manufacturer specification. Confirm exact form (extract vs oil) and concentration on COA.	"Natural peppermint extract" — confirm whether it is peppermint oil or extract and use accordingly on label and listing

CLAIM	LOCATION IN DOSSIER	STATUS	EVIDENCE BASIS	APPROVED LANGUAGE
"Most complete anti-fishy-burp system in India"	§7, §14	⚠ **Verify regularly**	Based on competitive survey March 2026: Ace Blend has peppermint only (no enteric). WBN 3x/4x have peppermint only. WBN 6x Ultra has enteric coating but with different flavour approach. Red Omega-3 uniquely combines enteric coating + peppermint.	"Enteric coating and peppermint together" is factually verifiable. The "most complete" superlative should be dropped for regulated copy. Use descriptive language: "enteric coating AND peppermint extract — a dual-system approach."

Science Accuracy Quick Reference — For Every Content Writer

✅ ALWAYS APPROVED

"EPA supports the body's eicosanoid balance toward anti-inflammatory pathways"

"DHA is the structural fatty acid of brain and retinal tissue"

"Astaxanthin is a natural carotenoid from Haematococcus pluvialis microalgae"

"Natural TG form absorbs approximately 30-50% more efficiently than EE form [Dyerberg 2010]"

"Eurofins independently verified our EPA and DHA content"

"Supports heart health / brain health / joint comfort / eye health"

"Astaxanthin is 6,000x more potent than Vitamin C by singlet oxygen quenching capacity"

❌ NEVER USE

"Prevents / treats / cures cardiovascular disease, Alzheimer's, or any disease"

"Clinically proven to improve heart health / brain function" (overclaim — too broad)

"FDA approved" (for the product itself)

"Guaranteed to reduce inflammation"

"Better than [named competitor]"

"The Astaxanthin is 6,000x stronger" (without singlet oxygen quenching qualifier)

"Zero side effects" (absolute safety claim not permissible)

30-Day Post-Launch Execution Roadmap

Everything that must be built after launch to reach the listing's full potential. Ranked by conversion impact.

P1

30-Night Money-Back Guarantee — Week 1 · Highest Single Leverage Action

Estimated conversion lift: +15–25%

Every buyer absorbs 100% of purchase risk today. The guarantee transfers it to the brand. At ₹1,199, this risk transfer is the final psychological barrier for 20–30% of buyers who are almost there. If Red Omega-3 works — and you believe it does — the refund rate on a genuinely good product will be <5%. That costs you almost nothing and earns substantial conversion uplift.

To build: Commercial decision on unit economics → guarantee copy: "Try Red Omega-3 for 30 nights. Feel the difference — or full refund." → badge designed and placed in Fold 9 CTA + Amazon Bullet 5 + CRM Day 3 pre-emptive reassurance → returns email + WhatsApp channel with 48hr SLA.

P2

Authority Endorsement — Doctor / Nutritionist / Cardiologist · Week 1–2

Estimated conversion lift: +10–20% on undecided buyers

Target: functional medicine doctor, cardiologist, sports nutritionist, or registered dietitian — Indian, credentialed, visible online.
The Eurofins story is the pitch hook: a supplement brand that voluntarily published its lab reports. Genuinely unusual in India.

Best profile: Integrative/functional medicine doctor with social presence in Indian urban health space who already discusses omega-3 or cardiovascular nutrition. Provide product + full dossier for genuine review — never scripted. Capture: headshot + credentials + 2-3 sentence quote referencing specific mechanism, not generic praise. Placement: Website Fold 1 trust strip + A+ Module 7 + Amazon listing backend.

P3

₹40/Night Price Frame Live on All Surfaces — Day 1 ← Do Now

Copy already written — this is an implementation checklist. Low effort, high impact. Deploy immediately.
Website Fold 1: "₹40 per night" green callout box above CTA · Fold 9 CTA block · FAQ "Why ₹1,199?" answer leads with ₹40 frame · Amazon catalog Image 7 supporting callout · CRM welcome email Week 1 · Meta ads A/B test "₹40/night" headline vs current headline.

P4

Three Essential Videos — Week 2–4

Video 1 — The Red Colour Story (60 seconds): Direct to camera, not scripted, warm. "Every fish oil capsule in India is yellow. Here's why ours is red — and why it matters." The Astaxanthin story told as a human moment. Most ownable brand video available.

Video 2 — Enteric Coating Animation (30–45 seconds): 2D animation. Capsule swallowed → stomach (coating holds) → small intestine (releases) → absorption. "No fishy burp" moment shown visually. Converts Persona 3 (gym) and Persona 1 (heart) most strongly.

Video 3 — Customer Testimonials (90 seconds): Real buyers at 30+ days. Pull from CRM. "Joint stiffness reduced" / "no fishy taste for the first time" / "my doctor noticed my triglycerides improved." Real homes, real faces, Indian context only.

P5

50 Reviews Target + Voice of Customer Pass — Week 2–4 → Day 35

Products with 50+ reviews see 37% higher conversion.
Generation sequence: CRM Day 14: "You've been taking Red Omega-3 for 2 weeks — has anything shifted?" + soft review request + Amazon link. CRM Day 21 WhatsApp: direct review link. Amazon native "Request a Review" automation for all fulfilled orders.

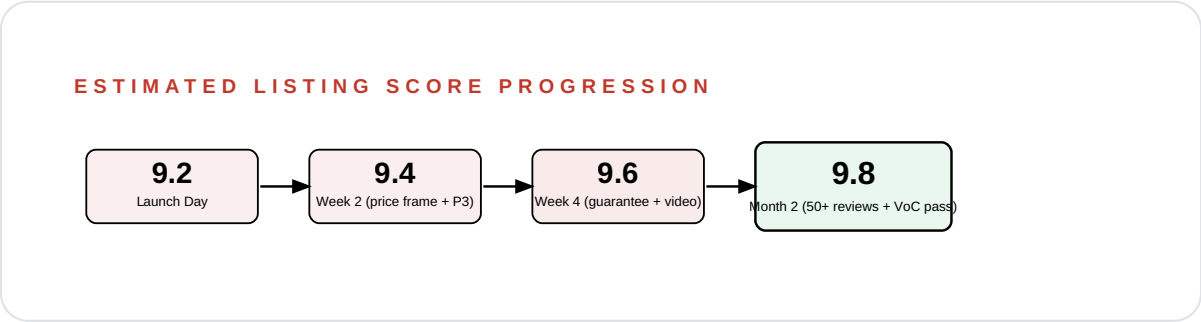
Language mining (Day 35): Read every review. Pull the exact language customers use. The phrases they write — not the phrases we wrote — become the copy update at Month 1. Update Fold 2 visceral opening with real customer language. Update Amazon A+ Module 2. Identify unexpected use cases (dry eyes, skin, mood) for new content angles.

P6

Split Testing Schedule — Week 3–4

One test at a time. Minimum 2 weeks per test.
Test 1: Amazon Image 2 headline — "Why Is It Red?" vs "70% of Fish Oils Fail This Test" · KPI: CTR from search
Test 2: Website H1 — "India's First Red Omega-3" vs "Most Fish Oil Is Already Rancid. Ours Isn't." · KPI: scroll depth + CVR
Test 3: CTA copy — "Get Red Omega-3 →" vs "Protect Your Cells →" · KPI: click rate
Test 4: Meta primary text — Red colour story opening vs oxidation/rancid opening · KPI: cost per purchase

Use Amazon Manage Your Experiments for listing tests. Use Hotjar + Google Analytics for website tests.



§ 17 · RETENTION STRATEGY

90-Day CRM Retention Sequence

The post-purchase communication architecture that converts first-time buyers into lifetime customers — mapped to the biology of omega-3 absorption and the psychology of supplement behaviour change

RETENTION PHILOSOPHY

"Most omega-3 churn happens between Week 1 and Week 4 — because the biology hasn't produced noticeable effects yet and nobody explained why. Your CRM sequence is the bridge between purchase and belief. It must explain the biology, set expectations, and celebrate the milestones before the customer abandons."

Phase 1: Days 1–7 · Onboarding & Expectation Setting

Goal: Prevent early abandonment by explaining why they won't feel it yet — and making that feel reassuring, not disappointing.

Touchpoints: Day 1 (order confirmed + what to expect) · Day 3 (the biology of omega-3 membrane remodelling — why Week 1 is subcellular) · Day 7 (what the first signs of effect feel like when they arrive).

Key message: "Omega-3 is rebuilding the molecular composition of your cell membranes. That takes weeks — not days. What you're doing right now is working at a level your body can't yet report back on. Stay consistent."

Phase 2: Days 8–30 · Belief Building

Goal: Build scientific belief and brand relationship during the window when first effects are emerging. Encourage noticing.

Touchpoints: Day 14 (the first effects check-in — joint comfort, reduced post-exercise soreness) · Day 21 (deep dive on one benefit based on purchase survey answer) · Day 28 (Eurofins trust-builder + review request soft CTA).

Key message: "At this stage, your cell membranes are meaningfully different in their EPA/DHA composition compared to Day 1. The changes you might be starting to notice — joint ease, clearer thinking, better energy — are real biology, not placebo."

Phase 3: Days 31–60 · Results Celebration + Re-order

Goal: Celebrate the results, anchor the habit, drive second purchase with maximum emotional momentum.

Touchpoints: Day 35 (voice of customer check — "what have you noticed?") · Day 42 (the 6-week science milestone — where triglyceride and cognitive data begins) · Day 52 (re-order reminder + 15% loyalty discount offer) · Day 60 (the long-term protection story — why stopping now is the worst thing to do).

Key message: "You're now in the window where your doctor would see the cardiovascular numbers starting to move. The protection Red Omega-3 provides accumulates with every day of consistent use."

Phase 4: Days 61–90 · Loyalty + Advocacy

Goal: Convert satisfied customers into brand advocates. Trigger referral, UGC, and social proof generation.

Touchpoints: Day 65 (referral programme introduction) · Day 75 (Astaxanthin deep dive — the hidden science story for curious customers) · Day 82 (family health angle — "share the red with someone you care about") · Day 90 (loyalty tier unlock + 3-month subscription offer).

Key message: "Most people who've been on Red Omega-3 for 90 days have noticed changes. Not all of them are the obvious ones — the ones that matter most might be the numbers your doctor checks."

§ 18 · "FEEL IT WORKING" PROTOCOL

"Feel It Working" Protocol

A product customers feel working retains 3x better than one they merely believe works. This section defines exactly what customers will feel, when they will feel it, and how to help them notice and attribute it correctly.

What Red Omega-3 Customers Will Feel — and When

Week 1–2: The First Subtle Signs

- ✓ **GI comfort:** The enteric coating eliminates the fishy reflux and stomach discomfort of standard fish oil. For anyone who previously experienced this, the absence of it is immediately noticeable on Day 1.
- ✓ **Less post-meal heaviness:** EPA's initial GI anti-inflammatory effect can reduce intestinal inflammation-related bloating in some users within the first week.
- ✓ **Slightly improved skin texture:** Early DHA incorporation in skin cell membranes — some users report skin feeling slightly less dry.

Week 2–4: Early Functional Changes

- ✓ **Joint comfort:** First and most reliably felt effect in physically active users. EPA-driven LTB4 suppression reduces joint inflammation. Users report reduced morning stiffness and faster post-exercise recovery.
- ✓ **Dry eye improvement:** DHA and EPA support the lacrimal gland lipid layer. Screen-heavy users often notice reduced eye dryness and irritation in this window.

Week 4–8: Clearer Cognitive and Recovery Benefits

- ✓ **Mental clarity and sustained focus:** DHA membrane incorporation in neural tissue produces the most commonly reported 4–6 week cognitive effect — reduced afternoon brain fog, improved ability to sustain concentration.
- ✓ **Faster gym recovery:** By Week 4–6, active users typically report noticeably faster recovery — less soreness the day after training, maintained performance across consecutive training days. EPA + Astaxanthin synergistic effect.
- ✓ **Energy levels:** Improved cellular membrane function improves mitochondrial efficiency and ATP generation — users report less fatigue and more sustained energy through the day.

- ✓ **Mood evenness:** EPA's serotonin receptor modulation effects become noticeable — reduced anxiety edge, slightly improved stress response.

Month 2–3: Measurable Biochemical Changes

- ✓ **Triglycerides (blood test):** Most reliably measurable change. 20–50% reduction in serum triglycerides at 1,271mg EPA+DHA over 6–8 weeks is documented in clinical literature. Users who test at this point will see real numbers move.
- ✓ **CRP (if tested):** Reductions in C-reactive protein (systemic inflammation marker) typically emerge at 8–12 weeks of consistent high-dose omega-3.

CRM TEMPLATE — DAY 14 CHECK-IN MESSAGE (BRAND VOICE)

Subject: "Two weeks in — are you noticing anything yet?"

Red Omega-3 works differently from most supplements you've tried. It's not building toward a moment — it's rebuilding your cell membranes, molecule by molecule, from the inside out.

At this stage — two weeks in — most people notice the first signs in their joints or their recovery after exercise. Things like: less morning stiffness. Faster recovery after the gym. Eyes that feel less dry on long screen days.

Some people don't notice anything obvious yet. That's completely normal. The biology is further along than it feels. EPA and DHA are now measurably higher in your cell membranes than they were on Day 1. That's real progress — even if your body hasn't reported back on it yet.

The changes that matter most — the cardiovascular markers your doctor checks — are the ones building quietly in the background. They'll start showing up at Week 6–8 in a blood test.

Keep going. We'll check in again at Week 4. — YourHappyLife

§ 19 · PRICING ARCHITECTURE

Pricing Architecture & Value Story

The honest competitive pricing picture — including how to address the Ace Blend per-serving gap — and how to communicate ₹1,199 as the only rational choice

THE PRICING REALITY — INTERNAL BRIEFING

Ace Blend has an identical EPA/DHA dose (743mg + 528mg) at ~₹47/serving (verify) vs our ₹48/serving. WBN 3x is ~₹47/serving (verify). Standard fish oil is under ₹15/serving. Red Omega-3 is the most expensive per-serving fish oil in the primary competitive set. This must be addressed head-on in sales training, FAQ, CRM, and conversion copy. Do not avoid the price gap — own it by making it the quality proof.

₹48

Per serving · Red Omega-3 · 25 servings, ₹1,199

~₹47

Primary competitor per serving · ~₹1,399/30 servings at Flipkart (verify) · Same EPA/DHA, no Astaxanthin, plastic bottle

≈ Parity

Per-serving price gap vs primary competitor — effectively zero. YHL cheaper on some platforms.

₹450

Approximate cost of a standalone Astaxanthin supplement (4mg dose) for 25 days

The Price Parity Story — Same Price, Different Quality

At current market pricing, Red Omega-3 and the primary same-dose competitor are at approximate **price parity** — within ₹1–5 per serving across major platforms as of March 2026. On some platforms (BigBasket), Red Omega-3 is the cheaper option per serving. This changes the competitive story fundamentally: it is not a premium to justify, it is a quality difference to demonstrate at the same cost. **"Same price. Fundamentally different quality."**

The Bundled Value Argument (Most Powerful)

Red Omega-3 is two products in one: clinical-dose fish oil + 4mg natural Astaxanthin supplement. Standalone Astaxanthin (4mg, natural H. pluvialis grade) retails at approximately ₹700–1,500 for a 30-day supply from reputable brands. Even at the most conservative estimate of ₹700/month, adding Astaxanthin to Ace Blend costs ₹700 + ~₹1,399 (primary competitor, 30 servings, verify current price) = ~₹2,099+/month.

Red Omega-3 = ₹1,199 for 25 days (approx ₹1,439/month equivalent). You're getting more protection for less total spend than buying them separately. Use this in FAQ and ad copy.

The Quality Proof Argument (Trust-Based)

Ace Blend has never been independently tested by Eurofins or an equivalent internationally accredited laboratory. Their molecular form (TG vs EE) is not publicly verified. Their oil has no antioxidant protection in the matrix — what arrives at your cells is whatever the supply chain conditions left it in.

Red Omega-3 has two Eurofins accredited reports (ISO/IEC 17025:2017). Natural TG form confirmed. Astaxanthin protecting the oil from production to absorption. Glass bottle. Eurofins also confirmed we over-deliver on DHA.

₹15/serving is the cost of knowing what you're taking actually is what it says it is.

The Per-Day Framing (Removes Price Sensitivity)

"Red Omega-3 costs ₹48 per day. Ace Blend costs ₹33 per day." Stated baldly, that's a 45% premium. But framed correctly: "For ₹15 more per day — less than the cost of a single biscuit — you get Astaxanthin protecting your EPA and DHA from oxidation, a glass bottle that won't leach plasticizers into your oil, and independent lab verification that what's in the bottle is what the label says." ₹15/day is not a meaningful spend decision. It is a quality signal decision.

The Glass Bottle Story (Visceral + Tangible)

Fish oil + plastic + Indian summer heat = documented oxidation risk. Plastic containers are oxygen-permeable and can leach phthalates and BPA into oil. The glass bottle in Red Omega-3 is chemically inert. Zero leaching. Zero oxygen permeability. The paper canister is compostable. Ace Blend uses a plastic bottle. WBN uses plastic. Neuherbs uses plastic. Every competitor uses plastic.

When someone places a Red Omega-3 bottle on their kitchen counter, it looks different. It feels different. It signals a choice that a plastic bottle cannot match at any price point.

DIAGRAM 19.1 — THE REAL COMPARISON: WHAT ₹1,199 VS ~₹1,399 (FLIPKART, VERIFY) ACTUALLY BUYS YOU

Monthly cost comparison — apples to apples

MONTHLY COST TO GET EQUIVALENT PROTECTION TO RED OMEGA-3

Red Omega-3 (25 days = ~₹1,439/mo)	**₹1,439/month**	EPA+DHA + Astaxanthin + Glass + Eurofins
Ace Blend (30d) + Astaxanthin (30d)	**~~₹2,099++/month**	Still no glass, no Eurofins, EE form unverified
WBN 3x + Astaxanthin (30d)	**~~₹2,099++/month**	Lower dose (1,020mg EPA+DHA) + no glass

Red Omega-3 is cheaper than the equivalent combination of what it replaces.
Astaxanthin standalone + unverified fish oil + plastic storage = more expensive and less quality-assured.

Astaxanthin standalone pricing based on Indian market range for quality natural H. pluvialis products (₹700–1,500/month). Use internally and in consumer copy. Do not cite specific competitor prices in advertising.

Approved Pricing Copy — By Channel

FAQ / Customer Support

"Yes, some products with the same EPA and DHA dose cost less per serving. But there are three things none of those products have: 4mg of natural Astaxanthin protecting the oil from oxidation (that's essentially a second supplement in every serving), a glass bottle that won't leach anything into your fish oil, and Eurofins independent verification. When you add those up separately, Red Omega-3 is actually the more economical option — and the more accountable one."

Amazon A+ / Website

"₹48 per day. That's the cost of four-times-strength, Eurofins-verified omega-3 with Astaxanthin protection, in a glass bottle. Some products offer the same dose for less. None of them offer the same quality for any price."

Meta / Performance Ads

Headline: "Same dose. Different quality. Here's what ₹15 more per day buys you." or "Why we're more expensive — and why it matters." Both frames use curiosity + specificity. Avoid defensive pricing language. Make the premium feel like the smart choice, not the expensive choice.

Subscription & Bundle Strategy

3-Month Subscription — ₹1,099/month

₹100 saving per bottle (₹300 total saving vs one-time) + the "full benefits emerge at Month 2–3" message creates a natural bridge. Subscription converts Persona 1 (heart-conscious, long-term) and Persona 2 (cognitive, preventive) most strongly. Lead with: "Omega-3 isn't a 30-day supplement. It's a daily practice. The benefits compound. So should your savings."

Family Pack / 2-Bottle Bundle — ₹2,199

₹199 saving. Activates screen worker persona ("for you and your partner who also spends 10 hours on a screen"), heart-conscious parent persona ("for you and your parent the doctor recommended omega-3 for"), and the gifting occasion (Diwali, birthdays). The glass bottle makes a 2-bottle set visually striking — premium gift presentation without any additional packaging investment.

§ 20 · FULL CRM EMAIL COPY

Full CRM Email Sequence

Production-ready email copy for the complete 90-day post-purchase sequence — brand voice throughout

DAY 1 — WELCOME / ORDER CONFIRMED
Subject: Your Red Omega-3 is on its way. Here's what to expect.

Hi [First Name],

Your Red Omega-3 with Astaxanthin is confirmed and on its way to you.

Before it arrives, we want to tell you something that most supplement brands never say: **you probably won't feel anything dramatic in Week 1. And that's a sign it's working correctly.**

Unlike a pain reliever or a sleep supplement, omega-3 doesn't work acutely. It works architecturally — rebuilding the molecular composition of your cell membranes, gradually replacing the omega-6 fatty acids that dominate the modern Indian diet with EPA and DHA. That process takes weeks, not hours.

What's happening in Week 1, subcellularly: EPA and DHA are being incorporated into your circulating phospholipids. Your eicosanoid balance is beginning to shift. The membranes of your heart cells, brain cells, retinal cells, and joint cells are getting slightly richer in the omega-3 they've been short of.

You can't feel that happening. But it's happening. And in 3–4 weeks, you'll start to notice the downstream effects — in your joints, in your focus, in your recovery after exercise, in your energy.

When your bottle arrives: take 2 softgels with your largest meal of the day and a full glass of water. Every day. That's the protocol.

One more thing: **your capsules are red.** That's 4mg of natural Astaxanthin from Haematococcus pluvialis — the world's most powerful marine antioxidant — dissolved directly into the oil. Every other fish oil capsule in India is yellow. There's a reason ours is different.

YourHappyLife

Questions? Reply to this email or WhatsApp us — we actually respond.

DAY 3 — THE BIOLOGY EXPLAINER
Subject: Why the red capsule is protecting you from the inside (the science, simply put)

Hi [First Name],

You've taken your first few doses of Red Omega-3. Today we want to explain what's actually happening inside the capsule — and why the colour matters more than you might think.

Most fish oil oxidises. Not metaphorically — literally. The same property that makes EPA and DHA biologically active (their polyunsaturated structure) also makes them vulnerable to oxidation from heat, light, and oxygen. A 2015 study found that over 70% of commercially available fish oils exceed at least one industry oxidation quality standard.

Oxidised fish oil doesn't just fail to work. The lipid peroxides and aldehydes it generates are themselves pro-inflammatory compounds. You'd be taking an anti-inflammatory supplement that had become a pro-inflammatory one.

That's the problem Red Omega-3 was designed to solve. The 4mg of natural Astaxanthin dissolved in every capsule is not flavouring. It's a molecular antioxidant — the most powerful one found in nature — continuously intercepting free radical chain reactions that would otherwise degrade your EPA and DHA. It protects the oil in the bottle. Then, after you absorb it, it continues protecting your cell membranes from the inside.

The yellow fish oil capsule has no such protection. The red one does. That's what you're taking.

Keep going with your 2 softgels daily. The rebuilding continues.

YourHappyLife

DAY 14 — FIRST CHECK-IN
Subject: Two weeks in — what to look for now

Hi [First Name],

Two weeks of Red Omega-3. This is when things start to get interesting.

At this stage, your omega-6:omega-3 membrane ratio has measurably improved compared to Day 1. The EPA and DHA you've been taking are now incorporated into the phospholipids of your red blood cells, your muscle cells, and beginning to reach your neural tissue.

What some people notice at Week 2:
— Joints that feel slightly easier in the morning
— Faster recovery after gym or exercise (less soreness the next day)
— Eyes that feel less dry, particularly at the end of long screen days
— A slightly calmer stress response — less of the "wired but tired" feeling

Not everyone notices these things at exactly Week 2. If you haven't noticed anything yet — that's completely normal. The cognitive and cardiovascular benefits build over 4–8 weeks. You're not behind. You're on schedule.

The thing that will move most reliably at 6–8 weeks: your triglycerides. If you have a blood test coming up, make a note to check. At 1,271mg EPA+DHA daily, the research consistently shows 20–50% reductions in serum triglycerides over this window.

Keep going. Week 4 is when it really starts to compound.

YourHappyLife

DAY 28 — THE PROOF EMAIL
Subject: The lab report we published (and why most brands never do this)

Hi [First Name],

Most supplement brands test their products, confirm they passed, and the reports go into a folder nobody ever sees.

When our Eurofins results came back for Red Omega-3, we published them. On our website. Available on request. Not because we had to — because we believe if you're taking something every single day, you should be able to see exactly what's in it.

Eurofins Analytical Services India is one of the world's most respected independent testing institutions — 58,000 employees, 900 laboratories, 60 countries. They were not commissioned to make us look good. They were commissioned to test what was actually in the product.

What they found: EPA at 45.06 g/100g and DHA at 35.03 g/100g — consistent with our label claims at the fill per capsule confirmed. Both tests conducted to ISO/IEC 17025:2017 accredited methods.

In a market where label fraud is documented and independent testing is rare, we consider this our most important product credential. Not the red colour, not the glass bottle — the fact that we have nothing to hide and the paperwork to prove it.

Nearly one month of consistent daily use. You're building something real. The protection accumulates with every dose.

If you've been noticing any changes — joint comfort, recovery, focus, or anything else — we'd genuinely love to hear. Reply to this email. We read every one.

YourHappyLife

DAY 52 — RE-ORDER + LOYALTY
Subject: Your Red Omega-3 is running low — plus something for staying consistent

Hi [First Name],

If you've been taking 2 softgels daily as recommended, your first bottle of Red Omega-3 is nearly finished — or will be shortly.

This is also the window where, biochemically speaking, the most interesting things are happening. At 6–8 weeks of consistent daily dosing, clinical research consistently shows:
— Serum triglycerides: 20–50% reduction
— C-reactive protein: meaningful reductions in systemic inflammation markers
— Cognitive performance: measurable improvements in memory and processing speed in research settings
— Red blood cell EPA+DHA status: at or near clinical optimum

Stopping now — at exactly the moment the benefits are peaking — would be a bit like cancelling your gym membership the month you started seeing results.

Because you've been consistent, we'd like to offer your next bottle at ₹1,049 — a thank-you for building the habit. **[LOYALTY CODE: RED15]**

The protection Red Omega-3 provides doesn't have an end date. Neither should your supply.

YourHappyLife

Code valid for 7 days. Apply at checkout.

DAY 75 — ASTAXANTHIN DEEP DIVE (EDUCATION + ADVOCACY)
Subject: The molecule you've been taking for 75 days (and what it's actually doing)

Hi [First Name],

You've now had 4mg of natural Astaxanthin every day for 75 days. We thought you'd want to know exactly what it's been doing.

Astaxanthin is produced by the microalgae Haematococcus pluvialis as a survival mechanism — when the algae faces UV stress, it accumulates Astaxanthin to protect itself. It is the most powerful singlet oxygen quencher found in nature: 6,000 times more potent than Vitamin C, 800 times more potent than CoQ10, by singlet oxygen quenching capacity.

Here's what makes it unusual: it's fat-soluble but amphipathic — meaning it can span the full width of a cell membrane, protecting both the inner and outer surfaces simultaneously. Most antioxidants (Vitamin C, most polyphenols) are water-soluble and can't access lipid membrane compartments at all.

Preclinical research suggests astaxanthin may cross the blood-brain barrier, where it could provide neuroprotective effects. It accumulates in retinal tissue — documented in human and animal studies. It reduces exercise-induced muscle damage markers (creatine kinase) independently of omega-3. It synergises with EPA on the anti-inflammatory pathway — EPA modulates eicosanoid production, Astaxanthin inhibits the NF-κB signalling pathway — two completely different mechanisms, both anti-inflammatory.

When we say "three marine molecules, one complete system" — Astaxanthin is why that's true and not just marketing language.

If you have someone in your life — a parent, partner, or friend — who cares about their cardiovascular health, cognitive function, or joint comfort: you know what's in this bottle. That knowledge is worth sharing.

YourHappyLife

§ 21 · PERFORMANCE MARKETING

Performance Marketing Blueprint

Meta, Amazon, Google, WhatsApp — full platform strategy, creative briefs, audience targeting, and budget allocation

Meta (Facebook + Instagram) — Primary Acquisition Channel

META CREATIVE 01 — THE RED COLOUR HOOK (PRIMARY AWARENESS AD)

FORMAT

15-second Reel / Story. Static image A/B: Red capsule close-up (macro photography).

PRIMARY TEXT

"Every fish oil capsule in India is yellow.
Ours is red.
The colour is 4mg of natural Astaxanthin — the world's most powerful marine antioxidant — protecting your EPA and DHA from oxidation. From the factory. Through your stomach. Into your cells.
India's First Red Omega-3. EPA 743mg · DHA 528mg. Eurofins verified."

HEADLINE

Why Is It Red? (A/B: "Most Fish Oil Is Already Rancid. Ours Isn't.")

CTA

Shop Now → [Product page direct]

TARGET AUDIENCES

Primary: 30–55, urban India, health/wellness interests, supplement buyers, fitness apps users. Lookalike: Mag5x Pro purchasers (highest quality seed). Retargeting: Website visitors 7-day, Amazon product page viewers.

META CREATIVE 02 — THE OXIDATION STORY (EDUCATION/CONVERSION)

FORMAT

Carousel (5 slides) or 30-second explainer Reel.

HOOK / SLIDE 1

"You're taking fish oil to reduce inflammation. Here's why it might be making it worse."

SLIDE 2–4 (CAROUSEL FLOW)

Slide 2: "70% of fish oils fail oxidation standards. Rancid fish oil generates lipid peroxides." · Slide 3: "What's inside our capsule: 4mg Astaxanthin protecting every molecule of EPA and DHA." · Slide 4: "Eurofins tested. Every batch. Reports published." · Slide 5: "India's First Red Omega-3. Shop now."

TARGET AUDIENCES

Persona 1 (heart-conscious, 38–55) + Persona 3 (active recoverers, 24–42). Cardiovascular health interest + fitness supplement buyer overlaps.

META CREATIVE 03 — THE CLINICAL DOSE STORY (CONSIDERATION/ CONVERSION)

PRIMARY TEXT

"Most fish oil in India delivers 300–360mg EPA+DHA per serving.
Clinical cardiovascular guidelines recommend at least 1,000mg EPA+DHA daily for patients at cardiovascular risk (AHA).
Most Indians are taking fish oil at a dose too low to do anything clinically meaningful.

Red Omega-3 delivers 1,271mg EPA+DHA per serving — 4x standard fish oil — in Natural Triglyceride form (30–50% more bioavailable than standard Ethyl Ester).

Eurofins verified. India's First Red Omega-3."

TARGET

Supplement-literate audiences. Health optimizer persona (30–50). Retarget website "See the Science" CTA clickers.

META CREATIVE 04 — SCREEN WORKER EYE HEALTH (NEW · COMPLETELY UNOCCUPIED)

FORMAT

Static image or 15-second Reel. Visual: split screen — person staring at laptop, eyes dry/tired (left), same person looking refreshed (right). Or: close-up of red capsule next to a laptop screen.

PRIMARY TEXT

"You spend 10 hours on a screen every day.

Your retina is 60% DHA — the same fatty acid that's depleted by blue light oxidative stress.

Astaxanthin crosses the blood-retinal barrier and directly protects your photoreceptors from screen-generated reactive oxygen species. Clinical trial (Nakagawa et al., 2011): 4mg Astaxanthin significantly reduced eye fatigue in computer workers.

Red Omega-3 has both: 528mg DHA for retinal structure, 4mg Astaxanthin for oxidative protection. No other omega-3 in India has both.

India's First Red Omega-3."

HEADLINE

"Your Screen Is Depleting Your Eyes. Here's What Replaces What It Takes."
A/B: "10 Hours of Screen Time. What Is Your Retina Running On?"

CTA

Learn More → [Eye health landing page section] or Shop Now → [PDP]

TARGET AUDIENCES

Age 25–45. Interests: technology, computer, software engineering, finance, banking, IT professionals. Job titles: software developer, analyst, consultant, designer. Screen time app users. Urban metros: Bangalore, Mumbai, Delhi, Hyderabad, Pune. This audience has never been targeted by any omega-3 brand — zero competitive saturation.

META CREATIVE 05 — ACE BLEND DIFFERENTIATION (COMPETITOR CONQUEST · NO NAMES)

FORMAT

Carousel (4 slides). Static image strong option. Visual: Slide 1 = red capsule vs yellow capsule side by side. No branding on yellow capsule.

HOOK / SLIDE 1

HEADLINE: "Two fish oil products claim the same 4x strength. One of them is red. Here's why that matters."
VISUAL: Red capsule (labelled "With Astaxanthin") next to yellow capsule (labelled "Without Astaxanthin"). Clean, high-contrast, no competitor branding.

SLIDE 2

"The yellow one has EPA 743mg + DHA 528mg. So does ours. The difference: our oil contains 4mg of natural Astaxanthin — the world's most powerful marine antioxidant — dissolved directly in the oil matrix. It protects every EPA and DHA molecule from the moment it's encapsulated. Their capsule has no such protection."

SLIDE 3

"We also store our omega-3 in glass — not plastic. Fish oil + plastic + India's summer heat = documented oxidation risk. Glass is chemically inert. Zero leaching. And our EPA and DHA are independently verified by Eurofins — one of the world's largest testing networks. Not a domestic testing platform. Eurofins."

SLIDE 4

"Same dose. Completely different quality. India's First Red Omega-3." CTA: Shop Now →

TARGET AUDIENCES

Retarget: Ace Blend ASIN viewers (Amazon DSP). Supplement interest + previously engaged with omega-3 content. Lookalike of health optimizer segment. This is a conquest campaign — run at ₹5,000–10,000/month with tight ROAS targets. Pause if CPP exceeds ₹800.

META CREATIVE 06 — THE QUALITY PARITY ("SAME PRICE, DIFFERENT QUALITY")

FORMAT

Static image or short text-heavy Reel. Simple, direct, no-nonsense visual style.

PRIMARY TEXT

"Some omega-3 products offer the same EPA and DHA numbers. At a similar price.

Here's what you actually get with Red Omega-3 that those products don't have:
→ 4mg of natural Astaxanthin protecting the oil from oxidation (that's a separate supplement worth ₹700–1,500/month on its own)
→ A glass bottle that won't leach plasticizers into your fish oil
→ Two independent Eurofins accredited lab reports confirming exactly what's inside
→ Enteric coating + peppermint — the most complete anti-fishy-burp system available

At a comparable price per serving. Four more things. Zero questions about what you're taking.

India's First Red Omega-3."

HEADLINE

"Same Price. Different Quality. Here's What You're Actually Comparing."

TARGET

Retargeting: product page viewers who didn't purchase. Cart abandoners. Price-sensitive segment identified by behaviour (multiple visits, no conversion). This ad is specifically for the consideration-to-conversion bridge for price-hesitant buyers.

Amazon Sponsored Ads Strategy

Keyword Targeting Priorities

Tier 1 (High Intent — Exact Match): "omega 3 capsules india" · "fish oil capsules" · "EPA DHA supplement india" · "best omega 3 india" · "fish oil with astaxanthin" · "red omega 3" · "omega 3 for eyes" · "omega 3 for screen" · "omega 3 no fishy burps"

Tier 2 (Category — Phrase Match): "fish oil for heart health" · "omega 3 for brain" · "omega 3 for joints" · "omega 3 natural triglyceride" · "enteric coated fish oil" · "omega 3 for eye health india" · "astaxanthin supplement india" · "high strength omega 3"

Tier 3 (Competitive — ASIN Targeting):
Target ASINs of Wellbeing Nutrition omega-3 (3x and 4x), Ace Blend omega-3 — serve Red Omega-3 as alternative when customer views competitor product. At Ace Blend ASIN, lead with Astaxanthin differentiation. At WBN ASINs, lead with Eurofins verification + glass bottle.

Amazon Bid Strategy

Launch: Dynamic bidding — down only until 10+ conversions. Target ACoS: 35–45% in Month 1 (aggressive brand building), target 20–28% from Month 2. Separate campaigns per persona-keyword cluster for budget control. Allocate 60% Sponsored Products / 30% Sponsored Brands (brand header for "red omega-3" brand searches) / 10% Sponsored Display (remarketing). Daily budget: ₹500–1,000 in Week 1, scale based on conversion data.

Most important early signal: CTR on main image. If red capsule visual is working vs yellow competitors, CTR from search will be above category average. This is your first performance data point. If CTR is below 0.4%, test alternate main image before anything else.

Google Search — Brand + Intent Keywords

Brand Campaigns

Target: "YourHappyLife omega 3" · "Red Omega 3 India" · "YHL fish oil" · "red omega 3 with astaxanthin". Protect branded search immediately. Bid: Max CPC ₹15–25. These buyers are already considering you — protect the conversion.

Intent Keywords

Target: "best fish oil India 2026" · "natural triglyceride omega 3 India" · "fish oil without fishy burps India" · "omega 3 eurofins tested india" · "fish oil with astaxanthin india" · "omega 3 for eye strain screen" · "astaxanthin eye supplement india". High-intent commercial queries. Bid: ₹12–22 CPC.

Educational Keywords

Target: "oxidized fish oil india" · "natural TG vs ethyl ester fish oil" · "omega 3 how much daily india" · "fish oil for triglycerides india". Lower intent but high quality audience — serve awareness landing page. Bid: ₹8–14 CPC. Blog content supporting.

WhatsApp — Post-Purchase Retention Channel

WhatsApp Sequence Integration

Mirror the email CRM sequence in WhatsApp with shorter, more conversational versions. Key touchpoints: Day 1 (order shipped confirmation + first-dose instruction) · Day 7 (check-in: "how's the first week?") · Day 21 (review request — direct link) · Day 50 (re-order nudge with loyalty discount code). WhatsApp converts review requests and re-orders at 2–3x email rates in Indian market. Always include direct WhatsApp support option — genuine responsiveness is a brand differentiator.

Budget Allocation (Month 1 Suggested)

Meta: ₹15,000–20,000 (40% — primary awareness + conversion)
Amazon Sponsored: ₹12,000–15,000 (35% — highest intent traffic)
Google: ₹6,000–8,000 (18% — brand protection + intent keywords)
Content/Influencer: ₹3,000–5,000 (7% — Reel seeding)

Scale signal: If Meta CPP (cost per purchase) is below ₹350 at 2 weeks, increase Meta budget 50%. If Amazon ACoS is below 40% at 10 conversions, increase Amazon budget 30%. Red Omega-3's visual differentiation (red capsule) should produce above-average CTR — if it doesn't, creative is the first lever to test.

Clinical References

All clinical data cited in this dossier and in Red Omega-3 with Astaxanthin consumer-facing materials. Each reference linked to primary source. Must be reviewed by regulatory/medical advisor before use in advertising, packaging, or regulated product listings. Studies cited relate to ingredients or mechanisms — not to this specific formulation as tested, unless noted.

REF-01 **Bhatt DL et al. — REDUCE-IT Trial · New England Journal of Medicine · 2019**

Landmark RCT. High-dose EPA (4g/day icosapentaenoic acid) in statin-treated patients with elevated triglycerides. 25% relative risk reduction in major adverse cardiovascular events vs placebo. Most significant cardiovascular outcome data for any omega-3 product in history.

Used in: §2 (cardiovascular mechanism), §4 (EPA dose rationale), §15 (validation audit)

PMID 30415628 → PubMed

REF-02 **Calder PC — Omega-3 Fatty Acids and Inflammatory Processes · British Journal of Clinical Pharmacology · 2013**

Comprehensive review of EPA and DHA mechanisms across biological systems. Establishes the eicosanoid competition model, resolvin/protectin/maresin synthesis, and anti-inflammatory cascade.

Used in: §2 (mechanism section), §6 (synergy), §15

PMID 23441618 → PubMed

REF-03 **Dyerberg J et al. — Bioavailability of Marine n-3 Fatty Acid Formulations · European Journal of Clinical Nutrition · 2010**

Head-to-head comparison of natural TG, ethyl ester (EE), and re-esterified TG (rTG) omega-3 bioavailability. Confirms natural TG and rTG absorb approximately 30–50% more efficiently than EE form under identical conditions.

Used in: §7, §8 (bioavailability), §14 Amazon Bullet 2, §15

PMID 20703227 → PubMed

REF-04 **Jackowski SA et al. — Quality of Commercially Available Fish Oil Supplements · Journal of Nutritional Science · 2015**

Testing study. Over 70% of commercially available fish oil products exceeded at least one GOED oxidation quality standard (Peroxide Value, Anisidine Value, or TOTOX). Key evidence for the oxidation problem narrative.

Used in: §1, §3 (oxidation problem), §14 Folds 2–3, §15

PMID 26688722 → PubMed

REF-05 **Naguib YMA — Antioxidant Activities of Astaxanthin · Journal of Agricultural and Food Chemistry · 2000**

Establishes Astaxanthin's singlet oxygen quenching capacity relative to other antioxidants. Astaxanthin ~500x more potent than Vitamin E, ~6,000x more potent than Vitamin C by singlet oxygen quenching. Foundational Astaxanthin antioxidant potency reference.

Used in: §5 (Astaxanthin potency), §15, §21 email copy

PMID 11052752 → PubMed

REF-06 **Park JS et al. — Astaxanthin Decreased Oxidative Stress and Inflammation · Journal of Medicinal Food · 2010**

RCT demonstrating Astaxanthin supplementation reduces oxidative stress and inflammation markers in healthy adults. Supports independent anti-inflammatory and antioxidant benefits of 4mg dose range.

Used in: §5 (independent benefits), §6 (synergy)

PMID 20038973 → PubMed

REF-07 **SanGiovanni JP, Chew EY — The Role of Omega-3 Long-Chain Polyunsaturated Fatty Acids in Retinal Health · Progress in Retinal and Eye Research · 2005**

Comprehensive review establishing DHA as the dominant polyunsaturated fatty acid in photoreceptor membranes (~60% of PUFA content). Confirms DHA's essential role in visual function and retinal health.

Used in: §2 (DHA mechanism), §5, §6 (eye synergy)

PMID 15555528 → PubMed

REF-08 **Simopoulos AP — The Importance of the Omega-6/Omega-3 Fatty Acid Ratio in Cardiovascular Disease · Biomedicine & Pharmacotherapy · 2002**

Documents the Western/Indian dietary omega-6:omega-3 ratio (estimated ~20:1) vs clinically optimal ratio (4:1 or below). Foundational reference for the Indian omega imbalance narrative.

Used in: §1, §2 (India context)

PMID 12442909 → PubMed

REF-09 **Serhan CN — Pro-Resolving Lipid Mediators (Resolvins and Protectins) · Nature · 2014**

Landmark review establishing EPA and DHA as precursors to specialized pro-resolving mediators (SPMs): resolvins, protectins, and maresins. Establishes active resolution of inflammation (not just suppression) as an omega-3 mechanism.

Used in: §2 (EPA mechanism), §6

PMID 25317992 → PubMed

REF-10 **Bazinet RP, Layé S — Polyunsaturated Fatty Acids and Their Metabolites in Brain Function and Disease · Nature Reviews Neuroscience · 2014**

Comprehensive review confirming DHA comprises ~40% of polyunsaturated fatty acids in the brain. Establishes DHA's role in neuronal membrane structure, BDNF synthesis, and neuroplasticity.

Used in: §2 (DHA brain mechanism), §9 (Persona 2)

PMID 25284327 → PubMed

REF-11 **Raatz SK et al. — Enhanced Absorption of n-3 Fatty Acids from Emulsified Compared with Encapsulated Fish Oil · Journal of Nutrition · 2009**

Establishes that fed-state omega-3 absorption is significantly higher than fasted-state — up to 3x in some conditions. Supports the "take with your largest meal" protocol recommendation.

Used in: §8 (bioavailability — fed state factor), §10 (protocol)
